If you fall in the class of the indifferent, think the situation over and see if the advantage of having vegetables in the garden won't outweigh the disadvantages of producing them.

Even if you do have a special dislike for most vegetables, it is possible that the very things you don't enjoy are the foods that other members of your family need for proper nourishment.

* *

Recent rains have started pastures back in the right direction. Pastures that have been more or less dormant for the past several weeks are taking on a green look that is pleasing to the eye of any farmer.

However, the most rapid growth is being made by the weeds that were allowed to remain standing long after the pasture should have been mown.

"Clip 'em now" would be a good motto for all livestock men to adopt for the next several weeks. A weed filled pasture is far less productive. The small amount of rain which falls on those pastures is used up much more rapidly than if grass alone was growing on the land.

Farmers who clip their pastures at regular intervals through spring and summer say it pays better dividends than any other job requiring a similar amount of time.

Groucho Marx was dining in a Hollywood restaurant when the bus boy, carrying a huge tray of glasses, stubbed his toe. He went down in a deafening crash and splinter of glass. The restaurant was for a moment, stunned to silence. Then Groucho rose to the occasion.

"Ladies and gentlemen," he announced, "that was Johnny you just heard—stepping out of thousands of store windows all over the country."

Plant Lice on Tobacco Calls for Quick Attention

By R. H. Milton,

Tobacco Specialist
Tennessee Extension Service

Over the week end, I made a trip to Lexington, Ky., going up through the heart of the burley belt.

This trip gave me an opportunity to get first-hand information on the burley situation. The crop has been set in Central Kentucky. Only here and there did I see an area in a tobacco field that did not have tobacco plants in it. Some fields were near the button stage and other patches had just been set. There is a wide range in size and height of growth.

The block system has been resorted to this year. For instance, many fields showed three or four sizes of plants in the same field. This situation told me there had been a scarcity of plants on many farms and that slow plant growth or lack of a setting season had occurred over the 250 miles covered.

Good farming methods stood out like a sore thumb wrapped in a cotton bandage. The crops were earlier and a good stand had been obtained where a good seedbed had been made. Thorough preparation—land made free of clods by dragging, disking, harrowing, and dragging again—has paid off this year.

While I did not stop on the tour and make many field inspections; however, where I did stop I found plant lice. In no one field did I find a heavy infestation of lice, yet I did not examine any tobacco near the button stage that did not show a heavy infestation of lice.

Plant lice, as you may know, are discriminating in their selection. They do not give small tobacco much attention. They suck and attack the largest tobacco. So farmers should examine any large patches on their farm.

You may find tiny, gnatlike, soft bodied insects building up and beginning to suck the life out of your tobacco.

Now, I will venture a guess. Plant lice will prove to be the greatest menace that Tennessee tobacco growers have ever been confronted with.

J. Ben Thompson, county agent at Ashland City, asked me last week: "Why did they wait until 1946 to attack tobacco the first time?"

I don't know but it is my belief that unless the high temperature destroys them they will take a heavy toll out of this crop. If I had a field of tobacco and plant lice had already appeared on it, I would destroy them while the tobacco is small and the lice are few.

You will find killing lice on small tobacco is much easier and cheaper than on tobacco in the topping or suckering stage.

C. B. Bidwell was ill in bed when O. L. Farris and I visited him but he said: "Men, lice can do serious damage."

My motto is "Kill the Plant Lice Now."

I have found in most fieds observed to date that as the plant lice population builds up so do the ladybird beetles, a small red or orange beetle with back dots on each wing. The larvae, small alligator looking worms, have a ravenous appetite. Each devours the lice in large numbers, so do not kill the small golden beetle having black dots on each wing as they are your friends. Protect the ladybird beetles, and hope they will clean up the lice.

Not Enough. Heifers under one year of age cannot make satisfactory growth on pasture alone regardless of how good the pasture may be. It is essential to feed grain to these heifers. Feed nough grain to keep heifers in thrifty, growing condition. It is advisable also to let heifers under one year have access to good hay while on pasture.

Pigeon Snack In Pea Patch Puzzles Lords

London—(AP)—The question before the house of lords last week was: Does a homing pigeon always want to go home?

Farmer Tom Darby said no. Darby, who shot five of them while they were pecking at his pea patch said they liked the diet and had no intention of going home.

Arthur Hamps of Peterborough, Darby's neighbor and owner of the pigeons, said yes. Hamps said his pigeons just were having a snack en route to their lofts and had no intention of settling down in Darby's patch.

A county court agreed with Hamps and ruled that Darby must pay him $800 damages.

Darby appealed the case, on grounds that one of the judges of King James I ruled in 1619 that farmers were entitled to shoot marauding pigeons. But the court of appeals decided that this ancient law was outmoded. Birds could not be shot legally, the court ruled "so long as they retained the intention to return to their loft."

True Christian Likely to Be Termed "Odd"

In co-operation with the Denver Council of Churches. The Rocky Mountain News each Monday morning reports a sermon delivered in a Denver church the previous day. The reports are devoted to sermons by pastors of all denominations in churches affiliated with the council.

The actions and reactions of two leading public figures on the civil rights' issue were held up as examples by Rev. Arthur L. Miller, pastor of Montview Presbyterian Church, yesterday in illustrating his sermon: "Daring to Be Odd for God."

Rev. Mr. Miller said that "if we set out to becme genuinely Christian, there is a great probability that we will be held up as 'odd' "

"We have in America 13 million Negroes," he said. "They do not have the same rights as other citiens and everyone in America knows it, but when the President of the United States comes out squarely for civil rights for all, a great portion of America — both North and South — condemns him for his position and it will probably cost him the nomination of his party.

No one would question the courage of General Eisenhower on the battlefield, but in an article in a current magaine he was asked about civil rights.

Can't Be Applied to Life

"He ducked the issue with this statement: "We have race prejudice in America, and you can't make people like one another by legislattion."

"If we applied this statement to all of life, we would have this strange phenomenon: 'You can't make people honest by passing a law against stealing—therefore we should have no laws concerning theft.'

"For most of us, Christianity is something that makes us similar to everybody else," he declared "A great leader has pointed out, however, that unless Christianity has made you different, it hasn't made you Christian.

Stick to Convictions

"Having said you were a Christian are you willing to be odd for God? It is comparatively easy to make profession of faith — it is quite a different matter to stand out against the crowd and do what you, in your heart, are convinced is right.

"The American people are not thinking today — they are simply living on their emotions. We have to try, within the church, to think. "Would you care to be odd for God!"

Adventures in Good Eating

By Duncan Hines

If you want to make your husband a special taste treat tonight, serve him this apple pie. It is one of the finest I have ever tasted.

Mix together the following ingredients: 1 cup sugar, 2 tablespoons flour, 1-2 teaspoon grated nutmeg, 1-2 cup orange juice, and 1-3 cup melted butter. Peel and cut into fine blocks enough Winesap apples to fill a pie pan. Add the apples to the above mixture and thoroughly mix together.

Butter a pie pan heavily before putting in the pastry. Then fill with the apple mixture and make strips for the top. Pre-heat the oven. Bake at 400 degrees for 15 minutes. Then reduce oven to 250 degrees and bake for 35 to 40 minutes.

(Released by the Bell Syndicate)

Our Pacific Trust

Saipan, Truk, Bikini are familiar names, but who has heard of Lib, Ngoli, Kapingamarangi? They are all within what is now the Trust Territory of the Pacific Islands. This Trust Territory, comprising the Marshall, Caroline, and Mariana groups of islands, extends about a thousand miles north from the equator and includes a greater part of the area from Hawaii to the Philippines—two million square miles of water surrounding a myriad of tiny and larger tropical islands. Only 117 of them are inhabited by a total of 50,000 natives of Polynesian or Micronesian extraction. Formerly under German control, they were mandated to Japan following World War I and are now under our official wing.

Placed under Naval Military government following the conclusion of World War II, a program for bettering conditions was immediately started. Every village, no matter how small, over this vast area, was officially visited and complete data gathered.

It was determined that what was needed was not military domination but friendly aid and cooperation to help these people become self-reliant, establish better health and sanitation, elementary education, safeguard their lands and resources, develop their trade, industry and agriculture, and the physical restoration of war damaged property.

For the past two years, this plan has been materializing under the able guidance of Rear Admiral G. H. Wright. Dubbed by the Saturday Evening Post "Admiral of the Atolls," he is highly regarded by the natives of the whole area.

Vaccination and immunization is provided. Yaws is nder control and anti-tubercular work is progressing. Native medical and dental practitioners and nurses are being trained. Seven dispensaries of from 25 to 80-bed capacity are located throughout the area. A training program is supplying native teachers for island schools. A trading system provides them with needed goods, while at the same time marketing their produce—principally copra and handicraft. These are just a few of the things accomplished or under way.

A most admirable phase of this whole program is that the natives are not asking for or getting handouts. We are giving them medical assistance and help in instances of calamity, but otherwise they are rapidly getting on their own.

A truly commendable operation, the Navy is carrying it out speedily, efficiently, without fanfare, and withdrawing its official hand as rapidly as circumstances permit.

Wheat Crop Loans Will Be Available Again This Year

Loans on this year's wheat crop will be made again by the Commodity Credit Corporation, Carl Fry, PMA state committee chairman, said today.

Wheat producers who desire a loan must obtain necessary forms from their local AAA office, he said.

The loan rate on No. 1 wheat will vary from $1.99 per bushel in West Tennessee to $2.25 per bushel in East Tennessee, until the official loan rate is set on July 1.

The loans will be made on grain stored on the farm or in approved warehouses, Fry said. Farm stored wheat must be in bins constructed to afford safe storage against rats, weather and theft, and to permit fumigation of the grain.

Under the loan program a farmer is permitted to sell his grain as soon as the loan is repaid. Wheat loans bear three per cent interest.

In a Los Angeles paper: "My wife has left my bed and board, leaving me with a beautifully furnished five-room apartment. Whooo oopppeeee!"

—By Gardner, Parade.

THE COLORED

YMCA

Can Accomodate

TRANSIENT MALE PATRONS

When coming to Nashville you are requested to stop at the Colored Y.M.C.A., Fourth Avenue North and Charlotte Avenue.

The rooms are located on 3 floors. Splendid outside rooms with much of the modern conveniences.

It is located in near down town Nashville.
There are clerks on duty twenty-four hours every day.

The rents are reasonable.

If any man wishes to take permanent residence in the building, this can be arranged.

Come to the Colored Y.M.C.A. while in the city.

Fourth and Charlotte Avenues

Nashville 3, Tennessee

Plant Fall Vegetables Now for Full Crop Before Frost

By Dr. Floyd Bralliar

Garden Editor
The Nashville Tennessean

The first half of August should be a very busy time in the garden.

Now that most parts of middle Tennessee have had a fairly good rain with prospects for more to follow we should plant our fall crop of snap beans, beets, carrots, turnips, kale, squashes of all kinds, cucumbers, and in fact any variety of vegetable that we wish to have produce a late fall crop.

English peas should not be planted before the 10th or the 15th of the month.

Soak Seed First

A great many readers tell us that there is no use for them to plant beets and carrots in the summer time for they cannot get a stand. There is no reason why this should be so if they use the correct method. First soak the seed at least 24 hours before planting them. Then lay off the rows where the seeds are to be planted, making the furrows with the corner of the hoe. These furrows should not be over an inch deep.

Now thoroughly water and wait until the water soaks into the soil. Sow the seed and cover them as you would if you had never watered. This allows the seed to lie directly on the wet ground, ground that will stay wet for at least a week or 10 days.

Evaporation Prevented

The dry soil with which you covered the seeds prevents the water from evaporating. Had you waited until the seed had been planted and covered, to do the watering, it would have dried out within two or three days. By watering in the row, before the seed are planted, then covering with ordinary soil, the seeds will have time to come up before the soil dries out.

Of course we might water the rows every day or two but then the young seedlings would have to force their way to the surface, through the soil that had been packed hard in the water.

Important to Best, Carrot

This method of planting seed in furrows that have already been watered and covering them with ordinary surface soil applies to seed of any kind, but is especially important to beet and carrot seed as they are always slow about coming up.

It is highly important that as many people as possible plant a good fall garden and that they do it now. Last week I talked with the head of one of Nashville's fruit and vegetable houses. He told me that he had been in the fruit and vegetable business for 46 years. But never before in all his experience has it been so difficult to get good fruits and vegetables. If this be true now, it is up to us to play safe by growing our own vegetables for fall and winter use. Practically all kinds of vegetables must be planted within the next two weeks if they are to have time to mature before frost.

How to Cut Food Costs And Still Eat Well

Practical ways of cutting food costs and meeting scarcities are suggested in a new menu and recipe booklet, "Money-Saving Main Dishes," which the U. S. Department of Agriculture is distributing.

The 48-page booklet was prepared by the Office for Food and Feed Conservation in cooperation with the Bureau of Human Nutrition and Home Economics. It contains 150 recipes and serves as a food guide. Its suggestions for well-rounded meals provide homemakers with nutritionally-safe ways of saving both food and money. Copies of the booklet may be obtained by addressing a postal card to Food Conservation, Washington 25, D. C.

Better Methods Of Rural Education Heard At Columbia

New York City — (G)— Since rural boys and girls continue to flock to the urban areas for education, the educators conferring at the closing session of the annual work conference on the organization and administration of rural education at Teachers College, Columbia University, suggested the following improvements for rural education.

a. Provide vocational, health service, school supervision and educational leadership.

This could be done they agreed, by training high school students to drive buses for long distance transportation, since these schools could be the result of pooled resources of several counties: cooperative purchase of buses with state assistance, with adequate public and liability insurance, or the possibility of county or intermediate ownership, maintainance and repair of bus fleets.

The Bell Tolls

By Leonard H. Bell

LOOK TO THE TIMES

Again, we see all of the signs, as well as feel all of the fangs of an approaching depression. Colored people always do. It is a traditional thing, but we do not need to keep it so.

In all of the widespread ghettoes (Harlems) scattered all over this prejudiced country, the same pattern that presented itself before the dreadful depression of 1929 is again presenting itself. But there are some things that we can do ourselves to prevent the holocaust of misery and deprivation that overwhelmed us before.

We can act now to wipe out the young wolves that infest these little Harlems, preying on private citizens and merchant alike, to steal that which does them little good, and helps to wreck the morale and competence of the community.

We can curb the ever-growing prostitution, which is so prevalent in times of need among our girls—the flower and hope of our generation.

We can set up a louder clamor for economic and employment opportunities for both our young and old people.

We can seek to ebb the flow of cheap wine (sneaky Pete) that both saps the strength and the mental capacity of our youth.

Yes, we can and must do all of these things, if we would avoid the cataclysmic riots, the wholesale evictions of upstanding citizens, the heart-rending poverty that warps the soul and the harsh individualism that not only wrecks a nation, but tears asunder the sacred ties that bind together the hopes and destinies of a minority people.

Anderson Says Agriculture Needs Substitute for War

Agriculture needs something to take the place of war in the economy, said retiring Secretary of Agriculture Clinton P. Anderson in an address before the Economic Club of Chicago, Tuesday night.

"How ridiculous it is that agriculture has been really prosperous only while we were preparing for, engaging in, or cleaning up after a war," the Secretary declared. "We need an economic gyroscope to keep us on more even keel," he said.

Safety

Accidents about farm homes are often caused by leaving farm tools or implements where they cause stumbling and falls. Every farm should have a tool rack.

Drugs that Stop Seeds from "Breathing" May Save Millions in Grain Storage Losses

By Kris Kreeger

NEW ORLEANS—(AP)—By slowing down the breathing of seeds, government scientists have found clues to saving millions of dollars a year in losses of stored grains. years of research, have nearly eliminated the deterioration process in the laboratory and in some experiments made on a commercial scale.

Heat produced by breathing causes most of the deterioration The chemicals prevent the heat by slowing down or stopping the breathing. They do this by action or enzymes, organic substances in all living matter, which affect vital processes.

In tests on cottonseed and rice, a single spraying has been as effective as many repetitions of the mechanical cooling methods in general use.

Indications Favorable

Directing the work is Dr. Aaron Altschul of the agriculture department's southern regional research laboratory here. He says it will be a year or two before results are definite enough for general application— "but indications are very favorable, and we're getting closer."

Although cottonseed, rice and flax have been particular objects of study, Dr. Altschul expects to find sprays effective on cereal grains such as wheat, and seeds in general.

The problem of storing grains and seeds is an acute one, particularly in the southeastern area where average temperatures and humidity are both relatively high. Dr. Altschul estimates 20 to 50 per cent of stored cottonseed may be subject to loss in some places.

The matter is so important that mills in Georgia, Alabama, Louisiana and Texas are testing sprays on a commercial scale at their own expense.

Dr. Altschul explains the seeds "require" or breathe much as human beings do, taking in oxygen and giving off carbon dioxide and water.

Warm Atmosphere Created

When quantities of seeds are piled in storage, the breathing creates a warm moist atmosphere "like a room full of people."

The heat breaks up the chemical composition of the seed. For instance in cottonseed fatty acids might be produced, making the seed useless for food oil and fit only for soap. The heat might even parch the grain.

Rice becomes discolored, kernels split, taste is affected.

Mechanical methods are used in many places to keep seeds dry and cool. Air is drawn through cottonseed by fans. Rice is exposed to air by being moved from one place to another.

But in warm, moist climates these processes must be repeated through out the period of storage. And often seeds or grains in transit will be stored where mechanical drying is not feasible.

Government scientists already have tested some 300 chemicals, and about 45 more have shown some effectiveness. Dr. Altschul says at least 200 more will be tried

Several Drug Types

Effective drugs have been of several types, including simple esters, or combinations of alcohol and acids; compounds related to sulfa drugs, and some simple organic acids.

In cottonseed storage, Dr. Altschul says, "we've been able to equal the best done by mechanical means," in tests on a commercial scale.

For example cottonseed sprayed only when stored was as good after 70 days as some dried by air for 25 days during that period.

Sprayed rice showed "no respiration whatsoever" in a 25-day test untreated rice stored in the same place had to be cooled every four days, as is reached the danger point in heat produced by respiration.

In a laboratory test in preserving cottonseed for planting, 64 per cent of the chemically treated seeds sprouted into plants as compared with 34 per cent of those stored under usual conditions. Moreover, seedling plants from treated seeds were larger than the others during the time watched.

Plenty of Work to Do

The scientists still have plenty of work to do on proper combinations of chemicals, cheap production for commercial use, effects upon taste and other factors.

Laboratory work on the problem has been in progress about six years. And four years, commercial firms have been co-operating.

Working with cottonseed are Swift and Co. of Albany Ga., the Dothan Oil Mill Co. of Dothan, Ala., and the Cotton Products Co., of Opelousas, La.

Tests on rice are being made by Converted Rice, Inc., of Houston, Texas, and on flax by the South Texas Cotton Oil Co., Corpus Christi.

Several other firms are expected to join in the project this year.

Also assisting in the work are the federal bureau of plant industry, the Nation Cottonseed Products association and the Mississippi Agricultural experiment station at Stoneville.

Scientists Find Signs Of African Culture 5000 B. C.

Berkeley,Calif.—(G)— The shifting sands of the Sinai desert solved a minor mystery for the Northern party of the University of California African Expedition.

This is reported by Dr. William F. Albright, professor of Semitic languages at Johns Hopkins and archaeologist for the Expedition in the bulletin of the American Schools of Oriental Research.

During explorations in Sinai, Dr. Albright revealed, the expedition found small flints, including a large number of beautifully flaked crescents. He said it is known that the ancient people who made these flints represent a culture which flourishes between 8,000 and 5,000 b. c.

The crescent flints, the archaeologists said, are now believed to have been tips for reed shafts which served as arrows before the introduction of the true arrowhead in the Stone Age.

The mystery arose when the scientists found implements of the late Stone Age, nearby, but in no case were the ancient crescent flints and the later implements found at the same time or the same site.

Dr. Albright proposed that the shifting sands of the region alternately exposed and covered flint-strewn areas of plain, the ancient peoples using different areas in different periods of time.

Too Much Figuring

An onetime army statistician tells of a mess sergeant who, when asked how it came that his report on food wastage invariably read "No waste but 'bones," explained:

"When they get through, I makes them show me their plates. If there's any food left, I tells them, 'You go back and bolt down every scrap of that good chow your Uncle Sam gives you,' any they does. Why do I do that? Because regulation say I gotta report percentage of potatoes, percentage of beans, percentage of everything they don't eat and when I was a kid in school I never got as far as percentage."—New York Times Magazine.

It is not the arithmetic of our prayers—that is, how many. It is not the rhetoric of our prayers—how eloquent. It is not the geometry of our prayers—how long. It is not the music of our prayers—how argumentative. It is not the method of our prayers—how orderly. But how fervent and how believing are our prayers?—Bishop Hall

1,519 First Services Made by State Artificial Breeding Group in June

The Tennessee Artificial Breeding Association made a total of 1,519 first services to dairy cows during the month of June, it was reported today. There were a total of 2,331 services during the 30-day period.

The report stated that several of the counties of the state are showing a "considerable increase" in the number of cows signed up.

The next few months will be light in the number of cows bred, it was revealed. The bull stud will shut down from August 22 through September 5.

In the number of first services by breeds and conception rates by breeds based on 60-day non-returns on April 1 services, the breeds rated as follows:

Guernsey: April 1—101—71.3 per cent 60-day non-returns; Jersey: April 1—151—63.8 per cent 60-day non-returns; and Holstein: April 1—101—62.4 per cent non-returns.

At the July meeting of the directors of the Central Association, according to the report, it was voted that the organization will have an exhibit at the State Fair this fall.

Going Strong

"It is now generally realized that we are living in the petroleum age" says the Times, of El Dorado, Kans. "Part of the increase in consumption of petroleum products comes from a source of which most people do not often think."

That source in American agriculture. According to the Oil Industry Information Committee, the farms of this country now have 3,000,000 tractors which operate nearly 15,000,000 farm implements. Our farms in addition, are served by 1,880,000 trucks, 62 per cent more than they had in 1941, and 4,680,000 automobiles, an increase of 21 per cent.

What this means to American farming would take a great many weighty volumes to describe. Oil, like electricity, is one of those products which can perform an almost limitless service. And its ever-increasing use is one of the reasons why the productivity of American farms has risen dramatically in the past twelve or fifteen years, and farm income has gone steadily up.

At the end of its editorial the El Dorado Times said: "So when we recall the increased use of petroleum and its products in home oil burners, city traffic, the airplane, the bus and the diesel engine, let us not forget that agriculture is using its share too. As a matter of fact, we use 28 times as much petroleum as any other country. Use of oil is a measure of progress, and indicates that private enterprise is still going strong." And private enterprise, the paper could have added, is the real strength of this nation.

Cut Sharp Teeth of Newborn Pigs

A newborn pig needs a bit of dental work before he gets his first meal.

G. B. Philips, API Extension hog production specialist, advises farmers to cut the eight sharp teeth, commonly known as blackteeth, of young pigs immediately after birth. He says these teeth are temporary and are of little use to the suckling pig.

"These teeth," says Phillips, "if not cut," may puncture or bruise the sow's udder. Then she will not let her pigs suck. Consequently she will dry up sooner than she should and the pigs will not receive proper nourishment for growth and health. Cutting these teeth therefore contributes to a good pig crop."

Good tools to use in cutting the teeth are a pair of sidecutting pliers or nippers. Cut close but do not injure the gums of the tiny pig.

Do right and leave the results with God.—Talmadge.

Start at the Bottom, Babson Advises Youths Seeking Jobs

By Roger W. Babson

Babson Park, Mass., June 17—At this time of year thousands of young people leave school to look for jobs. Many are through with school. They want work by which they can make a living. Others are looking for summer jobs. They want to use their vacations profitably. Some of you young people have written asking for job-hunting tips.

Too many young people when asked what they can do, reply, "Anything." This is a sure way of NOT getting a job. Well, here 's some good advice from me: Collect a few facts about a company before you go for an interview. Know something about its product. Know why you want to work for this particular company. Be able to give enthusiastic reasons for wanting the job and to state definitely your own qualifications.

Tell the employment manager what work experiences you have had. Convey to him the kind of person you are. Give him the impression that you would be a good producer for his company because of your interests, abilities, experience and personality. Don't tell him you need a job. Talk of his troubles, not yours.

Start at the Bottom

The Babson Institute has contracts with hundreds of employers across the country. I have made a trip through the mid-west where I talked with employment managers, sales managers, presidents and directors of corporations. They report that, more than anything else, young people are in too much of a hurry. Remember you are worthless to an employer until you learn something about a company and its problems.

My father used to say, "It takes two years to make a two-year-old heifer." He was right. You can't sell until you know your product. There is no place like the stockroom to learn this fundamental. If you really want to go places on a job, be willing to start at the bottom and do your job well. Don't be afraid of getting your hands dirty.

One middle western employer is currently telling a story about a wealthy young socialite. This young man could have stepped into a lucrative family business. Instead he went to another manufacturer and said, "I am absolutely worthless to you but there is nothing I want more than to learn your business. The only way I can learn is to go into the shop and roll up my sleeves and go to work. I want that opportunity to start at the bottom and get a good background." The employer was so impressed with this young man's sincerity and foresight that he hired him on the spot.

Business Wants Producers

One thing employers will find out about you is whether or not you are a good producer. This will be determined by school records, part-time work experiences, confidential recommendations, and so forth. You would be surprised how easy it is for an experienced interviewer to size up a fellow who wants a job "gold-bricking." Time and again, I have neard businessmen say, "The young person who hasn't learned how to produce isn't worth a plugged nickel to me."

America is what she is today because of the blood and sweat of our forefathers. Only your willingness and ability to produce to capacity will keep her great. Hence, such traits as responsibility, persistence, courage and enthusiasm, will go a long way to help you act and get things done. Adaptability and flexibility, the power to think and reason clearly, are also traits much sought by employers.

Importance of Character

But above everything, the most important qualification is character. It seems to me that without question there is nothing more important in an employe than a strong character. The man of character is the man who gives an honest day's production, and then some, for his day's wages. He is the man who gets ahead. There will always be opportunity for well-trained, serious-minded, young people of character.

Dangerous Homes

The housing shortage has forced many people to move into temporary dwellings, where wiring, heating units and cooking equipment are frequently makeshift and unsafe. And that, in turn, has created a new and very grave menace to life from fire. As a tragic example, a woman in a Washington town recently left her infant children in a temporary shelter while returning a borrowed utensil to a neighbor next door. She returned home to find the house in flames and the children dead.

It will be a good many years before the housing shortage is eliminated. In the meantime, the problem of reducing the hazard in substandard structures is two-fold. The first phase must be a constant vigilance on the part of the families living in them. Everything must be done to make electric and heating euipment as safe as possible—and it should be done by a qualified mechanic, not an amateur handyman. Children should never be left without adult supervision. And some sort of approved fire extinguisher should be available for instant use.

Second, it is the duty of municipal authorities to constantly inspect dwellings, particularly those which are of a temporary nature, and enforce adequate safety codes. This will cause hardships—but o hardship is as serious as death by fire.

The hazard of fire can be serious even in well-built, well-maintained homes. It is critical in old rundown dwellings, or new "cardboard houses."

Did You Ever Hear This One?

A housewife answered the doorbell to find a little girl of 5 and her younger brother, relatively new at walking, both standing on the step. The little girl was all dolled up in an old formal of her mother's and a grownup hat. Her ittle brother was wearing one of his father's hats that wobbled on his head and an older brother's coat that hung almost to the walk. "I am Mrs. Smith," said the little girl in a very formal tone, "and this is my husband, Mr. Smith. We've come to call." The woman who had answered the call decidtd to play along with the youngsters and their act so she invited "Mr. and Mrs. Smith" in for tea. The kids walked in and sat down and the hostess went immediately to the kitchen for some cookies and milk. When she returned the callers were already headed for the front door. "Must you go so soon " asked the hostess. "I hoped you could stay for tea." The little girl tossed back an artificial smile. "We can't, thank you," she said pleasantly, "Mr. Smith just wet his pants."

"Tickets, please!" Sheepishly, the commuter looked up at the suburban train conductor.

"I find myself in an embarrassing position," he confessed. "This morning I left my monthly commutation ticket in my other suit, and tonight I seem to have left my wallet at the office. I have no ticket and no money."

"I wouldn't worry too much," sympathized the conductor, "Where are you going?"

The passenger named his station.

The conductor removed his hat and scratched his head. "Add this to your grief," he said slowly. "This train doesn't stop there."

"We cannot over-estimate the fervent love of liberty, the intelligent courage, and saving common sense, with which our fathers made the great experiment of self-government."—James A. Garfield.

Increase in Dark Leaf Support Prices

Springfield, Tenn., July 26—(Special)—Higher support prices for dark tobacco for the 1948 season to offset acreage reduction were predicted by J. Fred Murff of Ashland City, president of the Eastern Dark Fired Tobacco Growers, in his annual report released today.

Terming the past year as successful one for the association, Murff reported 2,529 new members without a single withdrawal.

Murff said this season's receipts of dark fired and One Sucker tobacco were heavy, falling slightly below those of the 1946 crop.

A total of 22,296,542 pounds of dark tobacco were received under the loan advance. Of this, 15,694,647 pounds were dark fired. Type 22, and 6,601,895 One Sucker, Type 35 tobacco.

The association advanced $6,283.378.02 on their portion of the 1947 crop. Roughly one-third of the two types was turned over to the pool by the membership.

The president declared that the past season's operation brought the total amount of tobacco handled by the association, since its organization in 1932, to 182,359,297 pounds for which $26,765,210.87 was advanced to the members.

"Prospects for European sales of dark tobacco are much brighter than a year ago," Murff said. He explained the recently announced subsidy program on dark tobacco, through which one-third of the price of dark tobacco going for export, was paid for by Section 32 funds. These funds are set aside out of import duties for the purpose of expanding foreign markets for farm commodities.

He brought out the fact that approximately 28,000,000 pounds of dark tobacco, with a value of over -9,500,000.00 would be exported under this program prior to December 31, 1948. Coupled with record sales before the announcement of the subsidy program, Murff declared that growers face the next marketing season in a much healthier position than last year.

The president's report dealt in considerable detail with long range farm legislation. It recited the work of association officials in securing a farm law which would give adequate protection to tobacco. Tobacco cooperative officials played an important part in the preparation and passage of farm legislation, which will continue the tobacco program essentially in its present form.

The 90 per cent parity support price is permanently maintained and Public Law 163 remains undisturbed. The latter relates the support price of dark tobacco to burley, which has proved so beneficial to dark tobacco growers during the past few years.

The annual report revealed the outstanding activity of the association in the field of legislation, as well as in the fields of prizing, storing and selling hogshead tobacco. The report emphasized the successful efforts of cooperative leaders in having tobacco included in the Marshall Plan.

Murff predicted higher support prices for dark tobacco for the 1948 crop. "This," he said, "will compensate our members for the drastic reduction in acreage, made necessary by an unfavorable export market. "One of the most important jobs being done at the present time," declared Murff, 'is our intelligent and aggressive efforts to expand foreign markets for tobacco."

"Working with other cooperatives, dealers, buyers, warehouses and government," he concluded, "we are not only seeking to maintain fair prices for growers, but greater volume of sales, which will increase our members' total income and will build a more prosperous tobacco industry."

Hog Prices Hit All-Time High on Two Markets

Chicago,—(UP) — Hog prices soared to new all-time highs at two livestock markets today and wholesale meat prices advanced at New York for the first time in 10 days

A load of top quality hogs sold for $32 a hundred pounds at Cleveland, setting a new mark for that market. At Chicago a load sold for $31.10 a hundred pounds, topping the previous Chicago record of $31 set only last Friday.

FELT ON TIME & LATE BANNERS
Beautifully Designed
Double Face. Size 11 x 14

TWO IN ONE Price $1.00

Good Morning
Sorry You Are
LATE
Glad To See You

Reverse Side Reads As Above

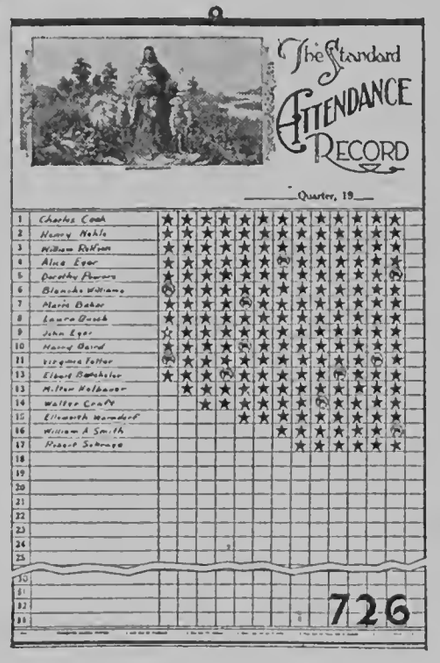
FELT CLASS NUMBERS BANNER FOR CLASSES FROM No. 1 to No. 16

Size 11 x 14, ready to hang
Price 80 cents each

TEACHER'S SUNDAY SCHOOL CLASS BOOK
Space for each pupil's names and addresses with record of attendance.
6c each, 72c dozen

BOYD'S CLASS COLLECTION ENVELOPE
For complete class attendance, records of pupils and visitors for each quarter.
35c dozen

VISITORS CARDS
Space for full information as to persons visiting your Church Worship Services, at 1c each for 90c a hundred.



ATTENDANCE RECORD

Attractive Wall Chart in Full Color
Standard Attendance Record
No. 726. Space for 33 names

Improve attendance and add interest in your children's classes by using this beautifully colored wall chart, in colors at the top of the chart. Then the thirteen small squares opposite the name spaces are for recording the child's attendance or record for the thirteen Sundays in the quarter. It is suggested that little gold stars be used to indicate present, red for absence, blue for out of town, and flag seals for sickness. Price of these stars, gummed is 15c a box of 100 of one color. Price of Attendance Record is 35c.

NATIONAL BAPTIST PUBLISHING BOARD
523 Second Avenue North. Nashville 3, Tennessee

There is no limit to what has been written and said about changing fashions for women — the "new look". Like it or not, it's created plenty of comment. But the grown-ups are not the only ones in the spotlight, for we think it should be noted that the small set is also wearing a new look.

Many of the saucy sixes and sevens have adopted the new short hair cuts, now so popular with the teen-agers. Even the four and five-year olds find it a relief to be closely shorn and thereby escape the untangling of long hair, always an irritating ordeal.

One look that never changes for youngsters, however, is that of freshness and crispness. How a little pinafore, starched till it almost crackles, can turn an impudent miss into a little earthly angel. And only a mother knows what a short time her little one will remain her shining self!

Such a problem to keep children well-scrubbed. Not just faces and hands but their clothes. Sometimes it seems outfits for the small fry are as expensive as those of their elders, not to mention how quickly they wear out or are outgrown. But take a tip or two from a smart young mother who knows how to conserve to get the most for her money.

Pinafores and sun suits which become faded from frequent launderings get fresh color with all-purpose dye. If it is a fragile little dress of light color, it is tinted a pastel in the washing machine. For numbers that are tubbed over and over again, color is restored in a simmering dye bath.

Another economy measure is the use of all good materials, no matter how old. Sun suits, for example, require such a small amount that most any faded cotton can enjoy a new career with bright color from all-purpose dye and a short session at the sewing machine.

THINGS THAT INTEREST WOMEN

By Bessie F. Belle

HOW DO YOU LOOK?

So your hair is turning gray! What if it is? Gray hair does not necessarily mean old age.

Even if your hair has turned gray should that make you feel old or look old? If one's face has been kept young, fresh and pretty gray hair can be beautifully cared for, and smartly coiffed and made very fascinating.

Select the most skilled hairdresser you can find and let him, or her create a new hair-do just for you, and follow his advice. I am told by one of New York's most skilled and best known hairdressers that gray hair should be kept exquisitely conditioned even if it does require tonics and pomades and a few extra trips to the salon for treatments. But you can do the daily brushing at home.

Then play up your eyes, apply a bit of lash coloring, a touch of shadow and brow pencil, remembering always to use the make-up discreetly.

ETIQUETTE SAYS—It is correct to eat small whole pickles with the fingers. Mixed pickles are usually eaten with the fork.

HELP FOR THE HOME EXECUTIVE

New rice and olive recipes tried at the University of California in Berkeley has resulted in a new dish.

The rice is a quick cooking, high vitamin product of the California rice produeers, called pearl rice. In one of the recipes used at the College of Agriculture, two ounces of dry rice were added to an eight ounces of chopped olives. Then sliced garlic, onions, chopped green pepper, salt, tomato sauce, and water were added and the mixture was cooked for 20 minutes in a pressure cooker. It made a good substitute for a meat dish.

Clip and save this receipe for your scrap book. There will be more next week and if you want my leaflets, "Slimming the Waistline" and "Minerals for Beauty" send a stamped addressed envelope to Bessie F. Bell, c-o Global News Syndicate, P. O. Box 86, Manhattanville Sta. N. Y. 27 N. Y

Envy of the World

The history of the word, since recorded time began, has been blackened at regular and frequent intervals by terrible famines. Countless millions have died miserably from hunger. And those cataclysms were not confined to long past, primitive times. In the last quarter century starvation has stalked through China, Russia, and other nations.

Yet, in the United States, we have never had a famine. Some may say short-sightedly that this is because we are blessed with an abundance of resources. But other countries, where the standard of living is abysmally low compared with ours, have great resources also. Some may think it is because we work harder. Yet in the hunger-ridden nations the average man and woman work much longer hours, and perform a great deal more manal labor, than does the average American.

The basic reason for our abundance lies elsewhere. It has been in a theory of government that encourages every man to do his utmost and reap the rewards that has stimulated voluntary, individual enterprise and that, finally, has given every man the right to compete with any other in his chosen field.

We see how this system works on every hand. As a simple example, every American can walk into a store and buy all the meat he wants—something that is impossible in most other countries. Free enterprise is responsible for putting that meat in the butcher's showcase—for turning steers, hogs and other animals into cuts that are ready for consumption. To meet the needs of the country, a great packing industry has been developed to bridge the gap between the livestock producer and our homes. It performs a vital service at a cost which is almost unbelievably small.

So it goes, in every field of enterprise. Free people, working in a free economy, have made the American standard of living the envy of the world.

For a luscious dessert
That's an epicure's dream,
Top cake with delectable
Maple whipped cream!

Yes, ma'am! A little maple syrup added to whipped cream is a wonderful topping for spice cake or gingerbread.

Fermate Effective Weapon Against Tomato Blight

By Dr. Floyd Bralliar,
Garden Editor

The Nashville Tennessean

We have been having a great many calls recently about blight on tomatoes; it would seem that we are in danger of suffering severe loss again this year if we don't do something about it promptly.

Fortunately, we have a new weapon with which to fight this disease. This weapon is fermate, a new preparation that appeared on the market not more than five years ago, and like most new things it has taken it considerable time to become known to the general public.

Satisfactory Fungicide

We quote from a government publication recently received, "It (fermate) is a generally good and satisfactory fungicide in that it protects against blackspot and rust when properly timed and it can be mixed with sulphur to protect against powdery mildew. It is less injurious to the plants than most copper and sulphur fungicides."

Last year and this year fermate has proved its value in protecting tomatoes from all kinds of blight, and is being used by the ton in tomato fields where tomatoes are grown for the large canning factories. It is relatively inexpensive, and we have been recently informed by one of the government's best plant pathologists that it is undoubtedly the best fungicide yet produced for general use. "Further tests are needed to learn more about fermate and how best to use it, for the different authorities do not agree entirely on the best methods of using it.

Dust on Plants

Fermate and sulphur seems to be the main materials used in the new all purpose garden dust to control plant diseases just as rotenone is almost universally used in these mixtures to kill insects. Probably the best way to use fermate in the family garden to control blight is to dust freely with some of these all purpose garden dusts, for all of these mixtures contain enough of it to do the work.

There is no danger of using these dusts on tomatoes for they are easily washed off and, practically everyone washes tomatoes before they eat them any way, and even if they did not do so, they would receive no injury.

If it is preferred to use fermate alone, it is said to be the best practice to make a mixture of four parts of sulphur and one part fermate, and apply it with the dust gun.

Pastures and Heifers

Pastures Won't Stay Good.

Most pastures are good at this time of year. Too many dairymen get the idea that their pastures will remain good throughout the Summer. Dairymen should be reminded that they will need supplementary grazing crops this Summer. It is not too early to be planning for this extra grazing.

Later in This Case

IOWA CITY, Iowa—(AP)—Sooner or later, it seems, want ads get results—of a sort.

Mrs. Ward McDowell, wife of a university of Iowa student, lost a purse in Minneapolis three years ago. The purse contained $50.08, keys (to a jewelry store), pictures of her baby and letters.

She advertised for it in a Minneapolis paper.

This week, Mrs. McDowell said, she received the purse in the mail from an unidentified sennder. It contained the keys, pictures, letters, a safety pin—and eight cents.

One way to get a good, lasting finish on your car is to try to beat the train to the crossing.

Trees, Shrubs Heavy "Eaters," Supply Them "Square Meals"

By Dr. Floyd Bralliar
Garden Editor

The Nashville Tennessean

Next to man, trees and shrubs are about the hungriest things we have to deal with.

They, too, sometimes need to be given the equivalent of extra vitamins to regain their lost vitality. It is up to the owner to see that they get that special needed "square meal" to keep them in the pink of condition.

After our exceptionally cold and dry spring, our trees and especially shrubs need nourishment to replenish lagging energy. While special feeding is effective any time the ground is not frozen, now is a good time to look after this.

Complete Plant Food

If you did not fertilize your shrubs and hedges early last spring, do so now. Last spring we recommended the use of stable manure or some other good organic fertilizer, but now the best thing we can do is to use a good commercial fertilizer.

For shrubs, one rounded tablespoonful of a complete plant food, which is rich in potash and phosphorus should be worked into each square foot of space around each plant. As soon as a plant has been fertilized, soak it thoroughly, using enough water to wet the ground to a depth of 18 inches. Because of dry weather few of our shrubs have made normal growth thus far, this season. And it is now time that they normally begin to set their flower bulbs for next spring's blooming. Lack of food and water now is apt to mean lack of bloom next spring.

Larger shrubs like lilacs, snowball, spirea, philahelphus, etc., may be fertilized two or three weeks late thought it is best to do it now. Holes eight to ten inches deep and one and one-half inches in diameter should be made around large bushes, in zigzag fashion.

Fill Holes to Top

Two handfuls of a mixture of half plant food and half soil should be placed in each hole. Careless workers often leave these holes open. But to do so means the soil will dry out quickly. It pays to fill all of these holes to the top. Tramp the ground enough to make sure that the holes are really full, then soak the soil around the shrubs, thoroughly. This may sound like considerable work, but we only do it once a year for the smaller shrubs, and only once every two or three years for larger ones.

We still believe that it pays to give most flowering shrubs a mulch of stable manure abeut the middle of December. The winter rains dissolve much of this fertilizer and carry it down into the ground to the roots of the plants, where it will be available at the first start of spring growth.

Manure Will Crumble

The manure will usually crumble of itself but if it should remain in chunks, break it to pieces with a fork or a rake just as new growth starts. In this way it will act as a summer mulch and will coninue to feed the plant. In most soils, if this manure is applied every fall, it will not be necessary to add commercial fertilizer oftener than once in four or five years.

It is now too late for pruning the early flowering shrubs. Flowering shrubs should ordinarily be pruned just as soon as they have finished blooming. This is especially true of deutizias, forsythias, and early blooming philadelphus for they produce their best bloom next spring on wood that grew this summer.

Cutting out much of the old wood, encourages free growth of new wood and so an abundance of first class bloom. But as these shrubs also produce some good bloom on the old wood, and it is too late to expect an abundance of new wood to form, it would be better not to prune it at all until after the flowers fade next spring.

There are a few shrubs that it is best to not prune in the ordinary way. One of these is spyrea van Houtil. If this shrub is cut back, it is likely to require three or four years to recover enough to bloom freely. On the other hand if the canes were cut off level with the top of the ground, new ones will come up at once, and within a year will have a fully grown shrub again. Experimentally, we have cut off extra large plants of spirea van Houtil level with the top of the ground as late as the last week in July. And had them make new tops full three feet tall by fall and produce a mass of bloom the folowing spring.

Cut Canes Off Level

Nandina, if cut back seldom branches at all. Like spirea if for any reason we wish to prune it, cut the canes off level with the top of the ground, and you will soon get a new plant.

Remove the dead flower heads from lilacs, but in doing so do not cut any of the true wood and be careful to not injure the large buds at the ends of the twigs, for these are the buds that will make the bloom next year.

While we are caring for shrubbery it is well to start a regular dustin gprogram that will control many of the pests that attack your favorite plants. For the last two or three years the great chemical houses have developed a new type of dust that will not only kill all insect pests but will prevent mildews, rusts and other diseases. No matter which section of the country you live in, you can now keep your shrubs free from insect pests and diseases by the use of this kind of material. Simply apply it according to directions with any good dust gun and the work is done.

Also be careful in mowing the lawn. Careless handling of lawn mowers does much needless shrub damage.

Tobacco Crop of 465 Million Pounds Expected This Year

A tobacco crop of about 465 million pounds is expected in 1948, according to C. G. Turner, of the Tobacco Branch, Production Marketing Administration, Washington, D. C.

The crop report indicated that farmers are planting 410,800 acres in tobacco (two per cent less than in 1947) and are expected to obtain a yield of 1,133 pounds per acre, the average of the past four years.

The total supply of burley tobacco as of October 1, 1947, the beginning of the current marketing year, was 1,425,000,000 pounds composed of carry-over of 941 and production of 848 million pounds, Turner said. This will result in a carry-over of about 905 million pounds on October 1, 1948, the second highest on record.

The fire-cured tobacco supply totaled 229 million pounds on October 1, 1947, consisting of 143 million pounds carry-over and 86 million pounds production. It has been estimated, Turner said, that domestic consumption and exports during the year ending September 30 will total 80 million pounds, resulting in a carry-over of some 150 million pounds.

The crop report of March 1 indicated 63,500 acres in fire cured tobacco (25 per cent ess than in 1947) and a crop of 66 million pounds, a supply of 216 million pounds is in prospect for October 1, 1948, when the new marketing year will open.

The price of the 1948 burley crop will be supported at 90 per cent of the parity price as of September 15, 1948. The parity price on May 15, 1948, was 47.1 cents per pound as compared with 44.8 cents per pound September 15, 1947.

Price on the 1948 fire-cured crop will be supported at three-fourths of the burley loan rate.

Heart Attack Fatal To Executive Of Most Widely Circulated Colored Newspaper; Formed Partnership With Famed "Bob" Vann 38 Years Ago

Pittsburgh, Pa.—Funeral services were to be held Thursday of this week from Wesley Center Church for Ira F. Lewis, 54, noted president of the Pittsburgh Courier Publishing Company, publishers of the most widely-read colored newspaper in the world. Mr. Lewis, stricken with a heart attack in New York recently, and later carried to a hotel died in that city on Saturday, August 28. News of his death spread to all parts of the country and shortly thereafter messages of condolence began arriving from everywhere for the stricken wife, other members of the family and the Courier staff.

Messages were received from President Harry S. Truman. Gov. Thomas E. Dewey and hundreds of other outstanding political, civic, and church leaders of the nation. All of these leaders knew Mr. Lewis personally and held him in the highest esteem. He and the newspaper he directed had rendered great service to many of them in the different phases of the nation's life in which they were engaged.

Born in Lexington, N. C., Aug. 25, 1884, he lived his early life there attended the public schools and later attended Biddle University, now Johnson C. Smith University. On his way up, Mr. Lewis worked as a hotel waiter. He often boasted of being a self-made man. Early in life, after he moved to Pittsburgh, he took up shorthand and served as a court stenographer, in which position he was widely hailed for his speed and accuracy. In this capacity he came in contact with many lawyers and political leaders. This later led to his meeting the man with whom he formed a partnership that later proved mutually profitable.

This partnership was formed with Ropert L. Vann, a struggling young lawyer, also a native North Carolinian. Together they launched the Pittsburgh Courier in 1910. The Courier's growth both in prestige and in circulation was tremendous following the first World War and has continued down through the years, until now this great weekly, with several editions, is read throughout the country and in all parts of the world.

Mr. Lewis as a business genius and Mr. Vann as a dynamic figure in political affairs, worked harmoniously in producing this great weekly which has had an influence second to nothing else in advancing the cause of the Negro in the United States and throughout the world. In all that goes to make a great newspaper, the Courier measures up to the highest standards and there is scarcely a daily newspaper that surpasses it in Nationwide influence. While the passing of the noted Robert L. Vann several years ago was a severe blow to the Courier, nevertheless, and largely through the untiring efforts of Mr. Lewis, the newspaper has made strides such as it would have made had Robert L. Vann lived until the present.

Mr. Lewis was courageous in every fight to give the American Negro the rights to which he is entitled under the Constitution. In 1945, he talked with President Truman at the White House and urged a square deal for the colored men and women in the armed services. He also talked with many of the major league officials and urged the integration of colored baseball stars into organized baseball. This was prior to the selection of Jackie Robinson by the Brooklyn Dodgers. Following Jackie's selection as a player, the Courier sent its sport editor, Wendell Smith to camp with the player and also had him follow the team on its trips to the various cities. The fair and full reports of Jackie's exploits as carried in the Courier played a major part in giving the first colored player what was needed to bolster his own morale and to get him that fair treatment he deserved.

Mr. Lewis. like Mr. Vann, always was unsparing in the use of funds to give the public the kind of newspaper it deserves. Thousands of those who are mourning the passing of Ira L. Lewis did not know him personally. But all are grateful for the enterprise that he and Mr. Vann showed in the kind of newspaper they gave the people of the United States.

Mr. Lewis was a member and vestryman of Pittsburgh's Holy Cross Episcopal Church on Centre Ave. He was also active in civic, educational, social and cultural activities, as they related to the city, state nation and to his race.

He is survived by his wife, Mrs. Harriet Lewis; two daughters, Mrs. Adelaide Lewis Scott and Jane Lewis Woodson; son, Robert Ira Lewis; brother Eugene Lewis; other relatives and a host of friends.

Truman Signs Bill Pegging Farm Prices, Raps Congress

Washington— (AP) — President Truman signed a new farm price support program into law recently with another blast at congress for going "only part' of the way to "meet the problems of American agriculture."

The bill, last major legislation approved by the republican-dominated congress before adjournment, generally continues present price supports until 1950. At that time new and lower price supports will become effective.

Wartime farm legislation expires at the end of this year. If the senate and house had failed to break their deadlock on the farm bill at the last minute, support levels would have dropped to 1938 figures on a few basic commodities. Supports for other products would have ended entirely.

In a statement criticizing the new bill, Mr. Truman said:

"The 80th congress did nothing to meet the serious problems of rural housing, health and education.

"In the field of agriculture as in so many others, most of the business of the 80th congress was left unfinished."

Among things Mr. Truman said congress failed to do with respect to farm legislation were:

Provide adequate funds for strengthening the soil conservation program;

Grant adequate funds for marketing research;

Enact a standby program for improving the diets of low-income families;

Act on the international wheat agreement "negotiated after years of effort to assure United States wheat producers of export outlets."

Extends Through 1949

The house first voted to continue the existing program 18 months, deferring action on a long-range program. But the senate adopted the Aiken bill, named for the Vermont Republican senator who was its principal author, providing a permanent program. Efforts to reach agreement between the two houses almost failed.

The final compromise version accepted the extension of present law, through 1949. The Aiken program then would take effect Jan. 1, 1950.

House leaders, who agreed to the program without any committee study of specific provisions of the senate bill, have said they may want to make some changes before it goes into effect.

There's an Easy Test For Grade A Eggs

St. Paul.—University of Minnesota farm school men say a housewife can tell whether high-priced eggs really are grade A.

If the egg has a round, high yolk, and if the cover of the yolk is strong and has plainly-seen white knots on its sides, the egg is grade A.

If the egg flattens out and runs all over the dish, or has barely-visible white knots on the yolks, farm school experts suggest buying elsewhere.

The latter, they said, may be perfectly all right but they're considerably less than grade A.

Our Appetite for Oil

If there is any limit to our appetite for oil it certainly isn't in sight.

According to a Petroleum Institute summing up, a record amount of oil will be available to this nation during the coming year. Yet, "the race to meet the enormous increase in consumption will be close." That means that it will be up to the public to practice reasonable conservation in using oil products so that there will be the fewest possible dislocations between demand and delivery.

It is estimated that during the 12-months period which started April 1, we will have an available petroleum supply of 6,025,000 barrels a day. That is about eight per cent above the amount available in the preceding year. In other words, all former records will be surpassed.

So large a production, it is pointed out, is conditioned on certain factors. There must be freedom from government interference and controls, which are always a deadening influence. The Bureau of Mines' forecast that imports of oil will exceed exports by 102,000 barrels daily must prove accurate. Expansive plans must not be slowed by strikes or other disturbances. And, finally, the flow of materials for new construction must be adequate.

There, in a nutshell, is the outlook for oil as it exists today. There is nothing whatever to indicate a serious shortage, or anything more important than occasional minor dislocations which usually occur when demand reaches 95 per cent or more of maximum supply capacity. And a little cooperation by oil users will obviate that annoyance to a very great extent.

Marengo Woman Beautifies Home

Mrs. Lugrether Lynch, of Rosenwald community, Marengo Co., Ala., has done an excellent job of home improvement. During the summer of 1947, the Lynch's old 4-room farm home was torn down and was used in helping to build the new home, which consists of 6 rooms and bath.

Mrs. Lynch has done much to add to the beauty of her new home. From sacks she has made a chenille spread at a cost of $3.65, and a value of $15.00; 6 pairs of pillow cases, 4 sheets and 2 quilts, at a cost of 20c for thread, with a value of $17.00.

Mrs. Lynch has made slip covers for 4 chairs at a cost of $8.00 at a value of $35.80. All curtains for the 6 room house were made by her.

A bookcase for the living room was made from pieces of scrap material left from building the new home, while only 20c was spent for paint. It is estimated that Mrs. Lynch has saved over $75.00 by doing her own work.

Scientific Farming, Plus Work Wins Out for Smiths

Gordon H. Turner
Staff Correspondent

CASH POINT, Tennessee — Success and happiness in achieving it are demonstrated on the 590-acre farm of the M. A. Smiths in this famed farming community of Lincoln County.

While hundreds of guests were eating a big barbecue dinner near a huge spring in a pretty grove in front of their farm, the Smiths told their story. Visitors had come from far and near to look over this whole show place of modern homes and farms. With a jam-up itinerary, the noon hour was planned to catch the crowd here.

The Smiths have lived on the same farm since their marriage 42 years ago. For a long time they did not do much good.

"As late as 12 years ago, our chief assets were a bank loan, many acres eroded in gullies, and ten children," the now prosperous farmer said. At that time his corn averaged 15 bushels an acre and it took two acres to producte a bale of cotton.

Determined on Action

But then the Smiths determined to do something about it.

"We decided we had farmed at this land long enough," Smith said. "We decided to spend more planning."

Following the best advice by agricultural authorities they were soon turning the old place inside out.

Now it is a farming paradise. The land is terraced, limed, and sown down or cultivated as best suited to the various fields. "We gave up haphazard hit-and-miss work", Smith said, "and began scientific farming, welcoming to our place all the advice and help we could get."

The same corn land which used to yield 15 bushels an acre, last year produced 94 bushels. And the cotton output had exactly doubled. Add in a lot of cold planning, hard work, and the big rise in crop values, and it spells the amazing difference between failure and success on this farm.

Born and Reared There

Born and reared on this place Smith helped cultivate the land as a boy with his parents, the Sim T. Smiths.

"I have plowed some of these fields myself for 51 years," he said.

When he married he began house keeping with his young bride in a little improvised house at the edge of the family farm.

"It was a little log shack way back in the bushes, if you want the truth about it," the wife explained.

In 1934 the family moved into the main homestead, where they still reside. This old home has come in for its share of modernization, too, With a fine water system and cheap electricity doing chores all about, the big house has every city convenience. It is beautifully decorated and furnished.

Strange as it may seem, these Smiths think they are seeing in their family the beginning of a reversal of a custom as old as the nation itself—that of a big family reared on the farm, only to grow up, and leave for life in the towns and cities. Most of the ten children either already farm or plan to farm, right on this land, or on adjoining places.

"For those to remain at home sections of land and houses are provided, or will be, as they grow up and get married," Mrs. Smith said.

The panoramas from this homeplace are magnificent in all directions, and a lot of it is man-made. To the north is a big field of fine alfalfa, beautifully terraced. Down front are the barns, and pastures, filled with white-faced cattle, and to the side are the grove with the huge spring and clear stream.

Beautiful Fields

To the west are fields of corn and cotton perfectly laid out and cultivated. Tractors, combines, and power equipment of all kinds are having a lot to do with this agricultural evolution. But mules and manual labor still count for a great deal.

It is no wonder that Cash Point's planning committee chose the Smith farm for a visit, a place run down and all but bankrupt a short generation ago. Books kept by Smith and two neighbor farmers showed their last year's combined income as more than $50,000, and their income tax as running well into four figures.

"Others can do it and are doing it, but it takes studying and staying on the job", Smith said, in a brief talk to the guests.

Mrs. Smith took many visitors through the pretty home.

"It's all too good to be true, just to think how far we've come since the start," she commented, in modest appreciation of their achievements.

"It took long days of hard work and little to do with, but we're thankful. The whole family has enjoyed the adventure into better farming. Best of all, though a few of the children have moved away, all of them still count it home."

Tomato Plant Find Made at Jackson

Hybrid tomatoes, with all the advantages of size, quality and abundance that go with hybrid production, are brought nearer to American tables by the discovery at the West Tennessee Experiment station in Jackson, of a tomato plant that is unable to shed its pollen.

Its significance is discussed in the forthcoming issue of Science by Dr. W. Roever.

In breeding hybrid strains of plants, it is desirable to have the female or fruit-producing individuals "male-sterile," that is, incapable of being fertilized by pollen from its own flowers. As a rule, much male-sterility is due to the production of defective pollen, or even of practically no pollen at all. This, however, imposes a handicap in that it is difficult to keep the parent line going on what few grains of good pollen can be found.

The tomato plant which Dr. Roever has discovered, however, does produce good pollen, and plenty of it. But the pollen sacs at the ends of the stamens simply fail to open, so that under natural conditions in the field there is no chance for self-pollination. The parent line can be kept going with pollen artificially extracted. In the field, hybridization is assured with pollen from a different line.

This pollen-hoarding tendency is a hereditary character, capable of being transferred to new lines of tomato plants by suitable breeding procedure.

Dr. Roever estimates that it will save about 75 per cent of the labor involved in hybridizing.

Billy Rose May Run Metropolitan Opera In New York

New York, N. Y.— (G) —Billy Rose, nationally known impressario and producer of Carmen Jones, may operate the Metropolitan Opera House, recently decided to remain dark during the Opera Season because of labor union trouble.

Mr. Rose has offered to take over the Met and run it for one year on a profitable basis, guaranteeing the directors personally, against any deficit with the offer to pay all losses if there are any. The heads of the Met reportedly have informed Mr. Rose that they were not casting for any impressarios, as yet but left him with a very favorable impression, that they, the directors, will be pleased to hear more about Mr. Rose's plan of operation.

Mr. Rose, when asked about his conversation with the Met Director was rather non-commital, however, he expressed himself as being thoroughly convinced that the wide public acceptance of Opera insures profitable operation under a business-like method, such as those which he has employed in his operations.

Jim Crow Shows Out In D. C. Will Go To Virginia

Washington, D. C.—(G)—Marcus Heiman, president of the United Booking Office and head of the national Theatre in Washington, recently closed its doors by an edict from Actors' Equity to revise its Jim Crow policy is planning to circumvent this issue by securing a theatre in Virginia. for an outlet of all legitimate plays booked for Washington.

The securing of this new Jim Crow theatre on the suburbs of Washington, but in another State will insure Mr. Heiman of continued profits through a policy not altogether in accord with our Democratic principles, but favored by many in this capitol city.

Only twenty minutes from the heart of Washington, the proposed theatre which is basically equipped to handle stage productions and at the same time would not require a large outlay for remodelling. With movie receipts dipping ,it looks more like the owners of the Virginia picture house would shortly come to terms with the Schubert controlled United Booking Office.

In the meantime, negotiations are still in progress for conversion of Washington's Belasco Theatre and Strand Theatre to legitimate houses on a non-discriminatory basis.

"Good to the Last Drop"

New York, N. Y.—When the S. S. Gonaarra sailed from New York on July 23 to Turku-Abo, Finland, it carried, as a part of its cargo 22,414 pounds of Brazilian coffee. The bags were marked for the Finnish Bible Society and were sent by the American Bible Society in commemoration of the 400th Anniversary of the first printing of the Finnish New Testament on October 3, 1548. You may ask what 10 tons of raw Brazilian Santos coffee have to do with the Finnish New Testament. This is the answer.

In June 1948 the American Bible Society was requested by Rev. Toivo Winter, general secretary of the Finnish Bible Society for a donation of 10 tons of raw coffee. This coffee will be forwarded to the Finnish Bible Society through the Finnish Committee of Christian Reconstruction at Turku. As the coffee is a free gift, it will be admitted without the payment of any duty. With the full approval of the Finnish Government, it will be retailed in the free market at a price that, it is estimated, will bring in Finn marks about 10 to 12 times the amount of the original gift.

The Bible House of the Finnish Society in Sortavala was completely destroyed in 1939 in the war with Russia. Sortavala is in Karelia, which is now part of Russia. The Fin marks received from the sale of the 10 tons of coffee will be used to purchase a new Bible House in Turku-Abo in which the meetings of the Finnish Bible Society will be held under the leadership of its president, Arch-bishop Aleksi Lehtonen. There also the activities of the Society will be carried on by its general secretary, Rev. Toivo Winter, and the other members of the staff. The coffee will be sold on October 3, 1948, when the 400th anniversary of the first edition of the Finnish New Testament, translated by Bishop Michael Ogricola, will be celebrated, and will be known as "Agricola' coffee.

Get Seed Now

Good seed of most crops are sorghum cane, peanuts, and grain sorghum seeds should be secured at once. To delay getting these may mean failure to find good seed. Careful farmers will check the tag for germination, purity, and noxious weed content.

Happy Old Age Rests on Ability to Prevent Rusting, Expert Says

By Alton L. Blakeslee
AP Science Reporter

NEW YORK—(AP)—One rule for a happy old age — don't grow rusty.

The rusting can be physical, with chronic ill health, or mental with boredom and lack of enthusiasm. Some tips to avoid both kinds were outlined by Dr. Edward J. Stieglitz, Washington, D. C., internist and authority on human aging, at a recent conference on old-age problems.

"First," he said, "we should teach children more about the basic biology of living, and how to use and care for their bodies. We should give children the same break that industry gives to buyers of new automobiles or vacuum cleaners. The buyers get instruction books on how to care for the car and how to avoid wearing it out too soon.

Body Education Urged

"Education should start in the school and home to teach children and youths to develop strong, healthy bodies. More attention should be paid to balanced diets.

"We educate children to become adults. Adults should be educated to live wisely and to prepare for old age. Anyone who doesn't antici pate old age is either stupid, or a coward."

Much of the physical rusting of premature aging and disabilities comes from abuse of the human body, Dr. Stieglitz warned.

One common abuse is fatness, which "is invariably due to overeating and lack of self disciplining. Obesity shortens life. The expected death rate may be increased as much as 174 per cent of normal when people are 25 percent or more overweight and have no complicating diseases."

Diets Deficient

Another abuse is diets deficient in needed vitamins, proteins, or other essentials. They cause lowered resistance to infection, lessened endurance, and invite fatigue, inefficiency and chronic disease.

A third is over-indulgence in alcohol.

A fourth is avoidable anxiety, which can be a factor in causing high blood pressure, stomach ulcers, goiters and other ailments. People can avoid them by self-education toward emotional maturity.

Someday, humans may live to be 100. Meanwhile, for persons past 40, Dr. Stieglitz offered some rules for wise living to stretch the life-span:

Eat, work, and play wisely. Prepare in advance for inevitable changes. Admit your limitations, and adapt yourself to them. Get a thorough health check-up periodically, and follow the advice.

Age brings many advantages, Dr. Stieglitz said.

Judgment Improves

Judgment usually improves. There is also more skill, due to more practice. There is more endurance than in youth, but less muscular speed. The ability to learn is about the same at 80 as at 12. Memory is about as good. There may be less speed in memorizing, but there is likely to be greater accuracy.

"The longer men live, the more time they have to think. To think is to grow, and to grow is to live. So there are exciting chances to live and grow in the latter third of life. The objective is to remain useful, to grow as you age, and not to rust."

Having a job, or otherwise keeping busy, is one of the biggest factors in happiness after 65, a study by Dr. Judson T. Landis, associate professor of sociology at Michigan State college showed.

Among a group of 450 old people, the happiest were those who had good health, who didn't have to depend on a state pension for their support, and who still were working and feeling independent, he found.

Those who worried were decidedly unhappy.

Women Usually Happier

Women generally were happier than men, Dr. Landis said. One reason is that women can keep busy at many of the same occupations like sewing or housework, as when they were younger. Men after retirement undergo a more abrupt change. Men **and women** with hobbies were happier.

The chance for happiness was greater in those with the greater education, Dr. Landis added. Partly this was because reading became a more important hobby, they also were more likely to have won financial independence.

The Cost of Your Groceries

"No food price collapse is likely —so long as wages and employment remain near present high levels," says a Wall Street Journal commodity letter. "The factory worker's weekly pay is now double prewar. And some 15 million more people have paying jobs than before the shooting started."

These are not the only factors contributing to high prices, but they are among the most important. The cost of food, much as we rail about it, is just a logical reflection of the economics of the day. It is true that agriculture's gross income has multiplied—but the cost of everything the farmer must buy, from labor to feed, has followed suit, and there is no get rich quick profit left when all the bills are paid.

The people who handle the food after it leaves the farm—manufacturers, canners, processors, packers,—have no means of reducing the price. Like all mass production industry, they operate on an extremely small profit margin. And they too must meet going wage and others costs.

Finally, the retail grocer who sells you your food is in exactly the same position. A number of chain food systems have issued graphic statements of what happens to each dollar spent in their stores. The profit remaining, after the bills are met, runs to about 1 1-2 cents per dollar of sales. In other words, if the retailers made no profit at all, it wouldn't make a visible dent in your food budget.

You are getting your food for the lowest price possible under the circumstances. That is always true in a competitive economy—the only kind of an economy able to combine peak efficiency with peak abundance.

$10,000,000,000, Worth of Meat

The tremendous importance of meat animals to the American farmer is revealed in Department of Agriculture figures. Last year these animals brought the farmer about a third of his cash income—nearly 2 1-2 times as much as he earned times as much as he earned from any other crop. And the totol paid to the farmer by the packers reached the astronomical figure of $1,0000-000,000.

Edible livestock, therefore, is the biggest single crop in the agricultural economy. And its importance doesn't stop there. Much of the $10,000,000,000 the farmers received went for feed, labor machinery, and materials of all kinds. Its impact was felt throughout the entire country.

This illustrates the fallacy of proposals to reduce our livestock population. The result would be an unnecessary financial blow to farmers, and to every section of America. Furthermore, our great and growing demand for meat is an inevitable development of our increasing population and the high living standards that prevail in the United States.

Equally important, experience indicates dangers that would lie in a return to rationing and price control. Under the competitive system, the farmer receives a fair price for his meat. Packers and other concerned in handling and selling it receive small profits per unit sale. And the consumer gets a sanitary product, of established quality, at the lowest possible cost, instead of black market robbery and uninspected produce.

There Is No Peace Like Home

Courts, Jr. and David are playing ping-pong; Jeanette is blowing bubbles; Billy Bob is alternately teasing Jeanette and begging his mother to go some place; and Sylvia is trying to listen to her favorite radio program and complaining rather vehemently because the others are making so much noise. Their mother is using all the fine arts of motherhood, augmented by years of experience, to keep the confusion within such limits that our household may not be reported for disturbing the peace of the neighborhood.

I am thinking of this subject: "There Is No Peace Like Home." When I told the children my subject. Sylvia suggested that it should be "There Is NO Peace at Home"!

If peace means cessation of noise and activity, she was eminently correct. But the absence of activity and noise is not peace; that is death. When Jesus promised peace he was certainly not promising his disciples exemption from actvity,. excitement, or opposition. Peace must be subjective before it can become objective. Peace is the union of three of the finest qualities of grace: love, faith, and a sense of security.

The peace of my home is not determined by the lack of noise and activity but by the absence of worry and unrest. On the school grounds. in the schoolroom. and in everyday contacts with other children and adults, my children face difficulties and meet opponents which are too great for them to overcome. The comforting thought that one may tell mother or father when he gets home is the source of peace in the very midst of confusion and defeat.

The faith of the child in his parents to help him to find a solution to his problems, the assurance that home offers a shelter and refuge from the difficulties of life, and the knowledge that love will leave nothing undone to guarantee his welfare make it possible for the child to find peace in the midst of turmoil and uncertainty.

The time must come in the life of every boy and girl when he realize that mother and father are not infallible or all-powerful. It takes more than human wisdom and ability to bring security and to stabilize home life. How fortunate the child who has already learned from his experiences at the family altar and through the giving of thanks at mealtime that real security is rooted in God and that such security is dependable and abiding!

Parents cannot well give to their children something which they themselves do not possess. They must have a consciousness of peace and security if they are to inspire such a spirit in the home. Their sense of security rests in their love for each other, in the affections and esteem of their children, and in their faith in God. The lack of any one of these factors will destroy their sense of peace and satisfaction.

Since no amount of theorizing concerning the need for peace and a sense of security in the home will place them there, it is well to seek some practical suggestions that may actually produce the desired results. Let us remember that peac is based on love, confidence, and a sense of security. These attitudes do not grow wild; they must be cultivated.

I offer, therefore, these simple suggestions that were worked out in a conference on home life at Ridgecrest which will help to grow a Christian home and a sense of peace that may be transferred in some measure at least to every other area of life.

1. I shall seek constantly to become a better Christian personally so that I may be fortified with peace in my own heart and thus better fitted for homemaking.

When at all possible I shall send at least thirty minutes each day with my companion in activities of common interest, thus deepening the wells of sympathy and love and building up the bulwark of common understanding that will be my defense against the enemies of peace.

3. I shall plan definite periods for play or activity interests with my children in order that I may know them better and that they may know mc better. Such play periods also reveal certain traits of character in my children which must be eliminated or directed or strengthened if a satisfactory basis for peace is to be achieved.

4. I shall do my best to make home building a co-operative enterprise for my whole family, taking the children into confidence in the major decisions affecting the family's life or welfare. Such a policy gives the child a sense of security and satisfaction in the home as well as training in the fine art at homemaking.

5. I shall cultivate love in my home and zealously as I courted my sweetheart, knowing that human affections are tender plants which are earily stunted or killed by indifference and maltreatment. These little courtesies to my companion and my children will bear large dividenls in respect and love.

6. I shall seek so to life and study as to quality as a confidant and counsclor for every member of my family. Confidence cannot long stand on ignorance, prejudice, or hatred. Honesty, sincerity, and wisdom are essentials to abiding peace in any home.

7. I shall so budget my time, my money, and my energy, as to make them produce the maximum of service and happiness for those of my household. No man or woman who dissipates character or possessions can hope to inspire confidence or assurance on the part of children or a life companion.

8. I shall have a regular plan for family worship and shall do all within my power to make that plan effective. The family is a divine institution and can only fulfill its rightful function as Christ is accepted as the head of the home. Pcace comes from Christ and Christ finds his contacts in my home through Bible reading. prayer, and family meditation on spiritual values.

9. I shall magnify Christ, the church, and Christian living both by example and conversation. I shall try to see that my child's faith in the spiritual values of life is not undermined by thoughtless criticism or opposition. Peace is the fruitage of faith and faith is often thwarted by gossip and dissension.

10. I shall oppose with all the fervor of my soul those forces which would destroy my home, the love that binds it together, the confidence that makes it secure. and the fellowship that makes it enjoyable.

Farm Fires Are Devastating

If you are a farmer, remember the summer fire hazards. More than 37 per cent of all farm fires are started by lightning. Keep your lightning rods in order.

Warm weather means dry hay and grainfields and the use of more gasoline and oil on farm properties. Fire from a spark or cigarette will strip a ripe grainfield as bare as a barn wall in minutes.

Each year 3,500 persons are burned to death on farms and some $90,000,000 worth of farm buildings, machinery and food crops are destroyed by fire.

During National Farm Safety Week, July 25 to 31, check your farm for firesafety. Frequent inspections are important. Look over your barn and house wiring, electric fences and electric equipment.

Check your hay for heating which leads to spontaneous combustion. Thrust a pipe into hay in barns and lower a thermometer into it. If it shows 158 degrees, watch it carefully; if above 185 degrees start moving it outdoors; if 212 degrees call the fire department. Check silos for heating of ensilage; also fertilizers, some vegetable oils, feed and lime.

Examine machinery to guard against sparks starting fires. Make safety rules for smoking and see that they are enforced. Dam a stream or dig a pool for emergency water.

You may save life and property by these fire prevention measures.

Follow the Recipe For Good Results In Washing Blankets

It's time for blanket washing! This task may be done nicely in the home, providing you treat the woolens gently. Since woolens are unpredictable, shrinkage and felting may occur. Therefore, manufacturers' directions should be followed carefully.

In her recipe for laundering blankets, Miss Margaret B. Doughty, director of Bendix Homc Laundry Institute, suggests the ideal washer load is one large blanket or two small ones. They should be shaken a bit to remove loose dirt and dust.

If the bindings are soiled, brush a soap solution on them with a soft brush.

"Woolen blankets are washed most successfully when lukewarm water is used for a brief, gentle washing and two rinses, when a mild soap or synthetic detergent is uscd, when the excess water is extracted quickly and gently, and when they are hung over two taut lines in a shady, breezy spot," Miss Doughty says.

Be surc that the water is lukewarm, she warns. To be absolutely certain, test it with your hand or a thermometer. A fairly high suds is desirable, but don't oversoap. And the washing must be brief—no more than three or mour minutes. Rinses in fresh, lukuewarm water of the same temperature as the wash watcr should follow immediately.

In hanging the blankets on parallel taut lines, hang them squarely for an even distribution of weight. Hang striped blankets so the stripes are up and down. Then if the dye runs, it will stay within the stripes.

Shrinkage and felting of woolen fibers will be kept at a minimum if this general procedure is followed, Miss Doughty declares, adding that instruction books with home laundrys may contain more specific and dctailed information on the subject. For laundering electric blankets, follow the manufacturer's instructions, she suggests.

New Literature on Dusts and Sprays

Chemicals Manufacturer Offers Guidance on Use of Dithane Z-78, Rhothane and Yellow Cuprocide

New York, N. Y.—Three new pieces of literature from a Philadelphia manufacturer of agricultural and sanitary chemicals offer tested counsel to help the farmer and market gardener defcat insects and plant diseases. The folders show how best to use the sprays and dusts which bear the trade names 'Dithane" Z-78. "Rhothane" (DDD) and "Cuprocide."

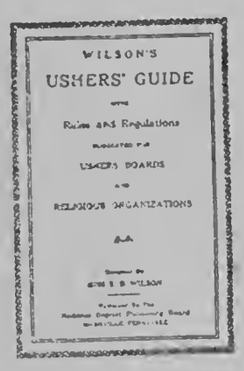
The folder on the new organic fungicide Dithane Z-78 features an illustrated reference chart in four colors which specifies spray and dust formulations, timing and frequency of application, and special instructions for control of blight, mildew and kindred diseases. The list includes tomatoes, potatoes, celery, cucurbits, beans, onions, cabbage and tobacco seedlings, azaleas and gladiolus.

The literature on Rhothane, or DDD, reprints a fact-filled article on the use of this insecticide to wipe out tomato hornworms. The folder also discusses Rhothane's use against corn earworms and borers, and suggests other applications where its relatively low toxicity to warm-blooded animals is advantageous.

"How To Guard Big Yields from Blight" condenses into eight pages the characteristics, in spray or dust form, and the recommended usages of the copper fungicide Yellow Cuprocide. Copies of all three are available without charge from the Rohm & Haas Co., Agricultural & Sanitary Chemicals Division, Washington Square, Philadelphia 5, Pa.

USHER GUIDE

WILSON'S



WITH SUGGESTED RULES AND REGULATIONS

We recommend it, because this book is simple in its presentation, but large enough in its scope to help ushers individually or collectively.

PRICE $1.00 per copy

USHER BADGES Are Made To Order

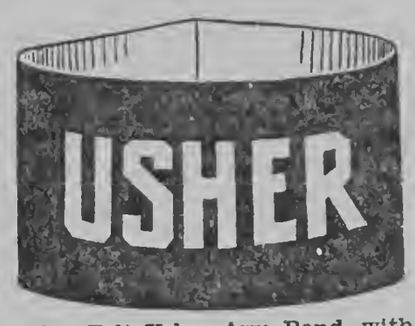
THIS BADGE IS A BEAUTY

Two colors of ribbon used, one side for general use, other for In Memoriam, one side printed in Silver, the other side is printed in Gold. In the bar we will place station of officers (not name of person) On face of badge any wording desired, including name of church. Always give full information. Price $1.50 per badge. No. C. O. D. Orders.

USHERS' ARM BANDS

Stenciled in white made of blue wool felt. 4 inches wide.

Price 50c each



Blue Felt Usher Arm Band, with sewed white letters of white felt. Very durable and attractive.

Price $1.00 each

OVAL SHAPED USHER ARM BAND

These Ushers' Arm Bands are very attractive; made of high-grade felt material, in colors red, blue and green, each with white letters, and elastic band to fit around the arm. Size 6½x4¾ inches, 30c each; $3.00 a dozen.

USHER STAR

A silver five pointed two inch STAR word USHER engraved in black. with hook clasp pin.

PRICE $1.00 EACH

Send all orders to the—

Gov. Dewey Names Dr. Haynes, Fisk Alumnus, Trustee of NYU

New York Governor Becomes First In U. S. To Choose Colored Leader For Membership On State University Board

Pawling, New York, August 26.—Gov. Thomas E. Dewey today announced the appointment of George Edmund Haynes as one of the fifteen trustees of the New York State University, authorized by the State Legislature last March. Recommendation for the creation of a comprehensive University System for the state was made to the Governor and the Legislature last February by a Commission on a State University with Owen D. Young, chairman. Dr. Haynes was the only Negro member of that Commission, and as far as can be ascertained, he is the first Negro to serve on an overall controlling board of trustees of any state university.

Dr. Haynes has had a lifetime connection with higher education. He is a graduate of Fisk University (Nashville, Tenn.) an M. A. of Yale University, and the first Negro to receive a Ph. D. from Columbia University. Following a ten-year professorship in Social Science at Fisk University he served on the board of trustees of that institution; he was one of the organizing members of the board of trustees of Dillard University, New Orleans, La., and served that institution during its first critical years. He is the founder of the Association of Negro Colleges and Secondary Schools and co-founder and first executive director of the National Urban League. Last year he completed twenty-five years as executive secretary of the Department of Race Relations of the Federal Council of the Churches of Christ in America of which work he is now secretary emeritus. In 1947 he made a second comprehensive survey tour of East, South, Central and West Africa for the World's Committee of the YMCA's and serves as their Consultant on Africa.

The New York State University System under the fifteen trustees just appointed will extend higher education to all in the state without racial, religious or nationality discrimination. Working out a master plan according to the new law is the task of the trustees over a period of six years. Dr. Oliver Cromwell Carmichael is chairman, and Arthur H. Dean vice-chairman of the board. Four of these trustees served on the former State Commission: Dr. Carmichael, Dr. Haynes, Mrs. Betty H. Donnelly and Dr. Paul Klapper.

Denominational Youth Leaders Plan Evening Worship, Recreation For Christian Youth Conference

Chicago, Ill.— Evening worship and recreation periods at the Christian Youth Conference of North America, to be held at Grand Rapids, Mich., Aug. 33 through September 5, will be arranged and conducted by leaders of two denominational youth fellowships, according to Rev. Dennis Savage, conference director.

A half hour of worship at 9 p. m., will close the conference program each evening. Responsible for this feature will be the Evangelical and Reformed Youth Fellowship. Miss Kitty Kline, national chairman, will head the group planning the services. Miss Kline is also chairman of the United Christian Youth Movement, which is sponsoring the conference.

Many unusual types of worship experiences are being planned, Mr. Savage stated. The services will be related to the daily themes of the conference.

Recreation planned by leaders of the Methodist Youth Fellowship will be enjoyed each afternoon at 4 p. m., by the 5,000 delegates in attendance. Among the many events arranged are folk games and songs. There will also be demonstrations for recreational leaders. Films will be shown, and several interest groups scheduled, Mr. Savage announced.

Rev. Larry Eisenberg, staff member of the Board of Education, The Methodist Church, and a recreation specialist, will be among those leading this phase of the conference program.

He Can't Help It

Anyone who thinks the retailer has an easy time of it should think again.

A Wall Street Journal reporter recently surveyed the situation in Newburyport, Massachusetts which a year ago made national headlines with a brave but short-lived effort to beat inflation by across-the-board price reductions. Newburyport is a small community, but it is typical of a large segment of this country. The reporter found that the merchants are more perplexed than ever. Sales are down 10 to 20 per cent. Inventories are rising. And customers are protesting high prices.

In a situation like this, the merchant is really caught between the devil and the deep blue sea. He has to keep his shelves well stocked—and at the same time he has to take extreme care lest he become loaded with goods that won't move. He has to keep on giving high standards of service. The retail store, whether it be a chain or an independent, can't afford to go backward.

The Newburyport Plan with its arbitrary 10 per cent cuts failed because the margin of profit on most goods is too small to make such a cut possible. If it had been continued long enough, storekeepers would have taken heavy losses and eventually courted bankruptcy. Whether the consumer realizes it or not, most stores, faced with the pres sure of tougher competition and buyer resistance, now earn unit profits which are less than the aver age before the war and during OPA On staple goods, the profit is only2 or three cents per dollar of sales, and in some cases, is even smaller. So don't blame your merchant when something seems to cost too much—he can't help it.

A Ten Strike

The beneficial result of continuous work by the Union Pacific Railroad in behalf of accident prevention and safety programs to protect its employes and the public, was never more gratifyingly demonstrated than in a letter written by a Union Pacific fireman to the Omaha World-Herald.

It carried a message to a boy and girl who drove across the track of a speeding train. "One second from eternity" is the way the fireman described the position they were in. His appeal to this unknown couple, through the news paper, which concluded with these words, "And for God's sake, don't try it again!" was so dramatic in its wording that it was copied throughout the country. It has been read by millions of people with resulting saving of lives that would have otherwise been sacrificed to carelessness.

One spontaneous outburst like this by an employe of a Company that has been doing everything in its power to teach safety practices to its own personnel as well as others. encourages it to do even more intensive work along the same lines.

"Look and listen for moving equipment," is a railroad slogan that means more today than ever before, not only on railroad property but on every street and highway.

Two matrons were discussing the problem of household help. "How long was your last cook with you?" asked one. "Oh, she never was with us," replied the other. "She was against us from the start."

Plan Now

To clip pastures now and continue to keep them clipped throughout the growing season.

To have an ample supply of pasture in July and August by seeding a few acres of sudan grass before the middle of June.

To leave that strip of small grain knocked down by the combine in making the first trip around the field for birds and other wild life.

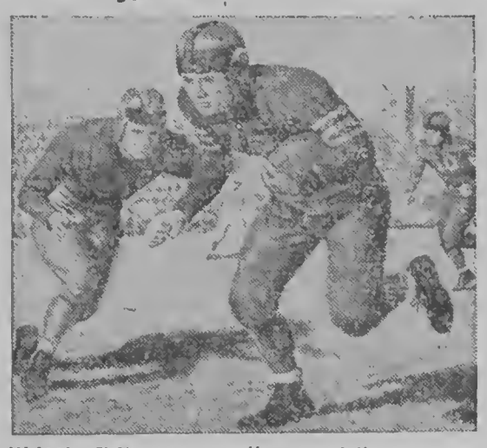
He (at movies): "Can you see all right?"
She: "Yes."
He: "Is the draft on you?"
She: "No."
He: "Seat comfortable?"
She: "Yes."
He: "Mind changing places?"

Letter from client to automobile salesman: "Dear Sir—Please repeat what you told me when you sold me my secondhand car, I am getting very despondent."

Imagine me growing dollars!

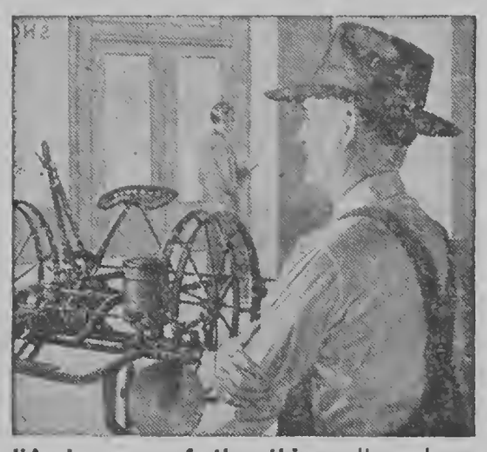
EVERY 3 DOLLARS I INVEST IN U. S. SAVINGS BONDS GROWS TO 4!

...and here's what that will mean to me in '58...



"Little Ed's set on college and I'm growing the dollars. Every $375 I put away in 'E' Bonds will grow to $500 in ten years.

"I'll finally get to take that vacation I've always dreamed of. Ann and I will fly clear down to Buenos Aires. Those Security Bonds will sure make 1958 a big year for me!"



"And some of the things I've always wanted and Mom's modern kitchen will start arriving when those savings bonds start paying off. Best of all . . .

AMERICA'S SECURITY IS YOUR SECURITY

Farm Talk With Farm Folk

By Jesse Safley

Farmers who are inclined to question the importance of crop rotation and continue to grow the same crops year after year could learn a valuable lesson by visiting the experimental station at the University of Illinois.

We visited some time back, with 40 other Tennesseans (members of the Farm Bureau on tour in Illinois and Indiana) and saw the oldest experimental plots in the country. These plots, which have been in use since 1876, afforded a most impressive lesson. The realization that years ago there were men who foresaw the ultimate fate of agriculture unless something was done to preserve the soil was significant and the proven facts were astounding.

Naturally, early experiment were devoted to corn as Illinois is located in the heart of the Corn Belt. Today, every type of field and pasture crop is included in the experimental program.

Back in 1904, a corn experiment was started on three plots. Each plot was divided into halves. Plot No. 1 has been devoted to corn from the very beginning. Lime and fertilizer were applied to one-half of it, while nothing was added to the other. Today the first half produces 62 per cent as much corn as it did at the start as compared to only 26 per cent for the second half.

Plot No. 2 has been used in a two-year rotation of corn and oats. A winter legume was sown following the oats on one half and nothing was done about the other half. The first half has maintained its original capacity, while the second half is only 71 per cent as productive.

Plot No. 3 has been devoted to a three-year rotation of corn, oats and red clover. Regular applications of lime and fertilizer were made on one half and nothing was added to the other. The first half has increased to 132 per cent of the original productivity, while the other is only 118 per cent as productive.

These experiments prove that the farmer can improve his land through proper management.

* * *

The Illinois station also conducts all types of experiments with livestock and field crops.

Spokesmen there had this to say about ladino clover (now proving profitable on many Middle Tennessee farms):

"We can hardly believe it is as good as we have proven it to be."

London, August 2—(INS)—Reuters reported today that financial markets in Shanghai were "thrown into panic" because of a rumor that war had broken out in Europe.

Always Remember This About Your Farm Garden

Now. "Can" a Winter garden. Plant enough beans, peas, tomatoes, corn, beets turnip greens, or other canning crops so that you can finish with canning before pests and dry weather become seri ous. Then if the late Summer and Fall are dry, you will still have a good Winter garden in cans.

Big Fault. Remember that failure to use enough fertilizer is still the greatest fault of most Alabama gardeners.

Lime. Use it once in every 4 or 5 years, except on the lime lands of the Black Belt. Broadcast 100 pounds of basic slag to a spot 4 by 33 steps, or 6 by 20 steps, or 10 by 12 steps. This is a rate of 2 tons slag (1 ton lime) per acre.

Manure. Use manure everyyear. The best amount to use is (a) big cotton basket full of (100 pounds) to 50 feet of row or to a spot 10 by 15 feet or 12 by 13 feet, or (b) a good wagon load (1000 pounds) to a spot 4 by 33 steps, or 6 by 20 steps or 10 by 12 steps. The rate is about 20 tons per acre. A smaller amount can be used.

Mixed Fertilizer. A good rule is to use 10 pounds (1 1-2 gallons of 4-10-7 or 6-8-4 to 100 feet of row for all vegetables except sweet potatoes. Use half that much for sweet potatoes and sirup crops. Ten pounds to 100 feet of row is about 1500 pounds per acre.

Value of Fruit Lowered by Poor Handling

The quality of a lot of fruit is lowered for commercial and home-use purposes because of improper handling at harvest time, State Horticulturist J. G. McDaniel said today.

"This is especially true in the harvest of peaches," he added.

Peaches properly harvested and graded will demand a better price on the market and will make a more attractive canned product.

The horticulturist listed a number of points which would improve the quality of the fruit. They were:

1. Don't pick the fruit with one hand. A correct picking container will allow the free use of both hands.

2. Don't drop peaches into the container. They should be handled like eggs.

3. Don's mash fruit to determine if it is ripe. This causes dark spots when the skin is removed.

4. Don't pick peaches with long fingernails.

5. Don't allow peaches to fall into basket when emptying picking container.

6. Don't pull tree branches down too far. Harvest fruit out of reach with ladder.

7. Don't skip branches and don't eat peaches and pick at the same time.

Remember way back when it was possible to know the price of a new car by reading the ads.

"That's a fine youngster," said the talkative old man to the young mother sitting opposite him on the train. "I hope you will bring him up to me an honest, upright American. And who knows? Maybe someday he will be a second George Washington."

"Yes" smiled the proud mother, "but this day and time I'm afraid that is going to be somewhat difficult, since—,"

"Oh, nonsense," continued the man. "As the twig is bent so is the tree inclined."

"I know," agreed the mother, "But this twig is bent on being a girl and we are inclined to let it go at that."

—Marion Robinson.

Plant early. Sweet potato plants should be set as soon as possible after the day and night temperature average as high as 70 degrees. This is usually about April 15 to 20 in Central Alabama. It is very important that the plants be set as early as the season will permit, because the vine cuttings should be put out as early as possible and the early set plants will produce a erop for midsummer market when prices are usually good. Harvest records show that every week during the fourth and fifth months after setting adds 25 bushels of potatoes per aere on good soil. Vine cuttings should be set by June 15 if possible.

Control Pests. Beans and peas should be dusted almost as soon as they are out of the ground. The same is true for cantaloupes and melons.

The new all-purpose dust approved by the Alabama Polytechnic Institute is good. Ask your dealer or your county agent about it. Cut worms are best controlled by use of poison bait. Chop a cabbage very fine, then stir while you sprinkle it with calcium arsenate. A good way to apply it is on freshly prepared land before cabbage and tomato plants are set; or it can be placed close to the plants after they are set. Cut worms feed mainly at night, so the best time to apply poison bait is just before dark.

Two Indians were discussing the sad state of world peace. One remarked: "The way I see it, when the nations smoked the pipe of peace in 1918, nobody inhaled!"

Negro Students Invited To Enter the Nation's Biggest Search For College Material

18 Four-Year College Scholarships And 53 College Entrance Prizes To Be Awarded by Pespi-Cola Scholarship Board to Gifted Negro High School Seniors

This month, the nation's most comprehensive search for unusual ability among Negro high school students will get under way. For the fifth consecutive year, boys and girls from the 1,663 Negro secondary school in the Southern states will be given an opportunity to take part in the 1949 Pepsi-Cola Scholarship program. Eighteen of them, who show marked promise of leadership, will win Four-Year College Scholarships, and approximately 53 will receive College Entrance Prizes. The awards, which are financed by the Pepsi-Coia Company, will total at least $50,000.

In the states which do not have separate school systems, Negro and white students will compete for 101 identical scholarships and at least 549 of the College Entrance Prizes which are offered by the Pepsi-Cola Scholarship Board.

Four hundred and twenty-five Negro boys and girls have already received Pepsi-Cola scholarship awards, and they are on the campuses of more than ahundred of the nation's white and Negro colleges this fall. A total of 5,188 boys and girls from 907 of the South's Negro schools have taken part in the past four programs, and at least 2,000 more are expected to participate in this fifth annual competition.

The 1949 selection will begin this month when elections are held among high school senior classes all over the country to choose candidates for the preliminary examination which the contestants must take. The finalists chosen on the basis of the first test will be announced in December, and they will take a final test in January. From the scores made on this second examination, the winners will be selected and their names announced in March.

Winners of the Four-Year College Scholarships will receive full college tuition, $25 a month, and traveling expenses for four years. Runner-ups will be awarded College Entrance Prizes worth $50 when the winners enter college in the fall of 1949; and those students who rank among the top ten per cent of the contestants in the country will receive Certificates of Distinguished Performance.

Any high school senior who wants to try for one of these awards can see his or her principal who has been sent complete information about the program.

Priority

A noted young concert artist was asked the secret of her success with her violin. "Planned neglect," she replied, and then explained "There were many things which demanded my time. When I went to my room after breakfast, I made my bed, straightened my room, dusted the floor, and did whatever came to my attention. When I finished my work, I turned my attention to violin practice. That system failed to accomplish the result desired, so I reversed things. I deliberately planned to neglect everything else until my practice period was completed. That program of planned neglect accounts for my success." Planned neglect may not sound good at first reading, but it is essential to give priority in the use of our time if we are to become efficient in the service of God and man. First priority is daily Bible study and prayer. "Seek ye first the kingdomh of God . . . and all these things shall be added unto you."—Practical Christianity

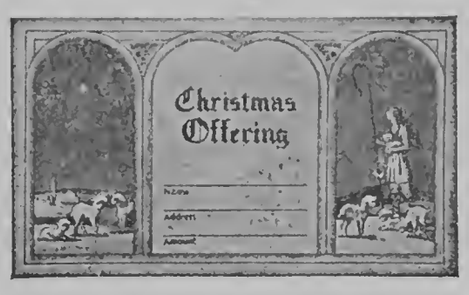
The fruits of the Spirit in terms of love are:
Joy is love exulting,
Peace is love in repose.
Longsuffering is love untiring.
Gentleness is love enduring.
Goodness is love in action.
Faith is love on the battlefield.
Meekness is love under discipline.
Temperance is love in training.

Christmas Helps

Our Christmas Exercise Edition of the CONCERT QUARTERLY

Is one of the most complete programs to be found. Full of beautiful Christmas Day Recitations, Dialogues, Playlets and Songs. Has no equal. 15c per copy—$1.50 per dozen.

CHRISTMAS BUTTONS
Beautifully lithographed in colors 5c each; 50c per Doz.; 50, $2.00; 100, $3.50.



Christmas Offering Envelopes

Artistically designed, produced in four colors, good quality of paper. Size 2½ x 4¼ inches—75c for 100; 250, $1.50; 500, $3.00.

Full from *Cover* to *Cover* of *New Material*

SONGS, RECITATIONS, DIALOGUES FOR CHILDREN OF ALL AGES
Price, 35c per copy

FOUR PLAYS FOR CHRISTMAS No. 1, A Pearl of Great Price—for 4 girls; No. 2, Silver of the Second Best—for 5 girls; No. 3, The Year's Great Guest—for 7 characters and 7 groups; No. 4, The Star Garden—for 7 characters and 6 groups—All in one binding; price, 35c per copy.
COME ANY TIME—A Christmas Comedy for 7 girls; price, 30c
WORSHIP THE KING—A Sacred Play—13 characters and chorus; price, 30c.
IN SANTA'S WORK SHOP—A play for children—21 characters. The group may be cut if desired; price, 25c.
HE CAME TO BETHLEHEM—A dramatic presentation for Christmas. May be used as a pageant. Price, 35c.
CHRISTMAS AT JOLLYVILLE JUNCTION—for young folks. A number of characters; price 35c.
CHRISTMAS EVE AND ALL IS WELL—A play in which any number may take part; price, 30c.
THE VISION ETERNAL—A Pageant Story Cantata—for choirs, choruses or selected groups; price 30c.
A CANDLELIGHT PAGEANT—with Familiar Hymns, Dialogues, Pantomime, Processional and Recessional. Price, 35c.

The USO—Back On The Job!

From: Community Chests of America 155 East 44 St., New York 17, N. Y. Murray Hill 6:5540

More than a year ago, Secretary of Defense James Forrestal foresaw that the creation of an enlarged military establishment would inevitably bring in its train grave problems affecting the welfare and morale of service personnel. Therefore he appointed a Civilian Advisory Committee to recommend a plan to meet these needs.

This summer the Committee recommended, and Secretary Forrestal approved, the reactivation of the USO for this purpose. In July, the Secretary asked that the nation's Community Chests assist in the support of the new USO by including it in their 1949 budgets to be raised in local Red Feather campaigns this fall.

The USO has never quailed at a big job. It will be, again, a two-way channel connecting every military post with Main Street, PSA. The six original agencies of the war time PSO—National Traveler's Aid (NTA), Young Men's Christian Association (YMCA), Young Women's Christian Association (YWCA), Jewish Welfare Board (JWB), National Catholic Community Services (NCCS), and the Salvation Army—after full consideration, have unanimously agreed to take on this new challenge.

At the present time USO is financing services for members of the armed forces in 65 communities. In additioan, USO funds are currently financing Veteran's Hospital Camp Shows, successor to USO Camp Shows.

New USO services will be based, beginning in 1949, upon requests from the Army, Navy, and Air Forces.

WHEN YOU GIVE THROUGH YOUR COMMUNITY CHEST_____ GIVE ENOUGH FOR USO, TOO!

M. and E. State Convention Donates To Panama Work

Panama City, Fla.—While some of the representatives down here from the Missionary and Educational Con vention who had intended to go to the National Baptist Convention of America in Oakland, Cal., were not able to make the trip because of circumstances over which they had no control, it was learned through Rev. Wm. Sutton that they have sent $41.07 for the work in Panama. The money was sent from here on August 25th to Rev. Henry A Boyd, secretary of the National Baptist Publishing Board, with whom he had been corresponding. He has already acknowledged the receipt of the money.

The Convention is presided over by the Rev. W. J. Johnson, D. D., and the work for the year shows every indication of increased membership and more contributions to the various objectives of the state and national work.

They are members of the National Baptist Convention of America, and early in August they promised to enroll in the 1948 session in the Northern California City.

Mrs. Bertha Foster-Jones Writes On the S S Congress

10101 Cedar Ave., Cleveland 6, Ohio, August 26, 1948. Dear Dr. Henry A. Boyd: It's a pleasure for me to write about the 44th session of Congress, which met in Kansan City, Mo., June, 1948. It was truly a grand session. The delegation was received with open arms. Through a well prepared channel of cooperation, the welcome sign was high. Thanks to the entertaining pastor, Rev. Williams and his co-workers. Therefore, in the spirit of our great leader, Dr. Henry Allen Boyd, whom God has given us, and has so wonderfully blessed with leadership. We did not fail to make every moment count, and every round will go higher and higher with such leaders.

So let us not forget the words of our very fine chairman, Rev. J. B. Ridley, when he said, "Let us build a monument to Dr. Boyd and read a book of his achievements while he lives." May God help us to put action behind these words.

Being a worker in the music department of the S. S. Congress, I am interested in the use and abuse of church music in our many churches. Therefore, I urge you to seek the best in songs. If you haven't already made your purchase, do so today. Use the song books published by our own National Baptist Publishing Board, who offers you the best.

I am happy to have had the opportunity of serving, thanks to Dr. Boyd and the Board.

Yours for service,
(Mrs.) Bertha Foster Jones.

Can Y'All Guess What Radio Voice Echoes Big Mules?

It is probable that there are few radio fans in Nashville who could miss guessing whom Henry Agard Wallace had in mind when, in his Birmingham radio address he referred to a certain radio commentator who makes a good living serving the "Big Mules" of the North who exploit the people of the South. The commentator made mob-inciting broadcasts during the visit of Mr. Wallace to the South and only slowed down after President Truman expressed his disqust with the mobsters who threw eggs and tomatoes at Mr. Wallace.

Regarding this radio commentator, Mr. Wallace said the following:

As for most of those who are inflamed to act against their own deepest Christian principles, I have the utmost compassion.

When a national radio commentator, who has always been a spokesman for the Big Mules—an actual spokesman for the National Association of Manufacturers—when he gets on his huge hookup and commends citizens who engage in violence, when he implies that those who attack me are defending their country, then I can understand how good people are misled. This voice has the power of a great network and respectable sponsors behind him when he speaks. Men and women who can't possibly keep informed on what I actually believe are likely to believe that this radio commentator is calling them to perform the highest patriotic duty.

In Greensboro, North Calorina on Monday, the police arrested a young teen-age lad for throwing eggs and tomatoes at me. When I heard about it, I asked the chief of detectives to release the boy. The boy was wrong. He shouldn't have done what he did. But it is the men who have inflamed his mind who are really responsible for violence.

They are never called to pay for their sins. A highly paid professional liar can use the air waves to incite the people of the South from his studio up north without reprisal, but a 16 year old boy—knowing not what he is doing, is arrested. This is not justice, as you and I who believe in democracy understand justice.

Rather Rare

When Dr. Charles A. Beard, the eminent political scientist, was spending a few days in a small Connecticut town, the postmaster asked him what kind of a doctor he was.

Dr. Beard explained: "Doctor of philosophy."

The postmaster scratched his head a moment and said, "Guess we don't have much of that around here."—This Month.

What this country needs is more people raising beans and fewer people spilling them.

The Purpose of The Tithe

The Tithe Has A Long History And Is Still in Force

The tithe is mentioned first in Genesis 14:20, where Abraham paid tithes to Melchizedek. The next is where Jacob pledged that, if the Lord would bring him home in safety, he would give him tithes of all he had: "and Jacob vowed a vow, saying, If God will be with me, and will keep me in this way that I go, and will give me bread to eat, and raiment to put on, so that I come again to my father's house in peace; then shall the Lord be my God: and this stone, which I have set for a pillar, shall be God's house: and of all that thou shalt give me I will surely give a tenth unto thee" (Genesis 28:20-22).

Then, in Numbers 18:20, 21: "The Lord spake unto Aaron, Thou shalt have no inheritance in their land, neither shalt thou have any part among them: I am thy part and thine inheritance among the children of Israel.. And, behold, I have given the children of Levi all the tenth in Israel for an inheritance, for their service which they serve, even the service of the tabernacle of the congregation." In other words, it was their part to preach their gospel to the rest and to offer up the sacrifices and prayers. Thus they were to keep the religious life alive.

Decine of the Tithe

There are other references to this law. But what became of the practice of it? Who received the tithe? And who did the preaching? There does not seem to have been any service rendered by the Levites except here and there. In Judges 17:1-13, a story is given of how Micah employed a Levite to be his priest. That might have been a common practice for the Levites, but no more is said. But what became of the setup of Levites' having charge of the religious instructions, preaching, or other services and the tribe's paying the tenth? The children of Israel were engaged in fighting their enemies, driving them from the land. But the tabernacle and its services seems to have been neglected. We see Eli in charge in First Samuel. The ark was taken captive, and restored under David. The Scriptures seem to be silent concerning the public worship, preaching, teaching, or other activities connected with the tenth and the services of the Levites. There were uses made of the tabernacle, but what of the tithe? The great feasts made by David, Solomon, and others were accompanied by acts of the Levites, but during the time between there seems to have been no activities by them.

In addition to the preaching and the teaching of the law, the fire upon the altar must not go out. But the writer of the Eighty-fourth Psalms, while admiring and praising the beauty of the Lord's house, discovered that the fire had gone out on the altar. "The sparrow hath found an house, and the swallow a nest for herself, where she may lay her young, even thine altars, O Lord of hosts, my King and my God." That showed the altar had been neglected. Birds are not building nests and laying eggs where a priest is standing and the fire is burning. This man came from a distance, perhaps, and found no priest at the altar.

Jesus And the Tithe

When Jesus came, he found the temple built and the Levites at work. But the setup was of Rome, and the priesthood was a donation to the high priest for some consideration to such men as Pilate. Jesus spoke of one Pharisee boasting in his prayer, "I give tithes of all I possess." At another time, Jesus reproved some who tithed all the tithes but omitted the weightier things of the law, justice and mercy. This showed that the Levites were neglecting their duty.

But the purpose of the tithe, as it occurs to me, was to pay for worship and preaching, keeping before the people the cause of God. Under the Christian regime, the tithe is still with us.

Malachi complained that the nation had neglected the tithe and that the nation had come to poverty. There were a few who met and told each other of how the Lord blessed them. But if they brought the tithe, it was moldy bread, sick animals, and nothing fit for the Levites to eat and attend to their duties. The "gospel of the Jews" was neglected because the Levites did not get their tenth promised at the beginning, and now Malachi is pleading for the tithe. "Bring ye all the tithes into the storehouse, that there may be meat in mine house, and prove me now herewith, saith the Lord of hosts, if will not open you the windows of heaven, and pour you out a blessing, that there shall not be room enough to receive it (Malachi 3:10). The natural result of preaching God's will to his people is for those who hear it to believe it and rejoice in it.

Since Christ came and apostles were sent out, the tithe is called for to provide for worship and pay the preacher's salary, that he may have his burdens taken care of. The purpose of the tithe is to pay preachers to carry the gospel to everyone, and that tithe paid by those who are able. Paul says: "How then shall they call on him in whom they have not believed? and how shall they believe in him of whom they have not heard? and how shall they hear without a preacher? and how shall they preach, except they be sent? (Romans 10:14, 15). The preachers are sent. And if they sent, one or more people send them. If the tithe is given and the gospel is preached and men believe it, we see how the windows of heaven are opened and the great blessings flow; also, we understand what is meant by flooding the world with the gospel light until we do not have room to contain it.

The gospel must be preached. The expenses of the preacher must be taken care of by those sending him or her. We must remember that the purpose of the tithe is to keep men and women. boys and girls informed as to God's will and his great love for the children of men. Let us bring all the tithes into the storehouse, and let us see the windows of heaven opened.

Tea Tasting in China

Walter K. Putney

Do you think you can taste two or three cups of tea and judge which is the most satisfactory? How would you like to be a real teataster, in China, and judge from seventy-five to a hundred cups a day? That is just an ordinary day's work for the professional teataster and that is one of the most peculiar and interesting professions in the world.

The professional teataster is usually a man of between forty and fift yyears of age and he reaches the top, in his work, after years of training. He starts as a young man, studying tea as it grows and is processed. Then he must learn the many grades in commercial use. Next he is permitted to be an assistant to an expert teataster and, in that work, he learns what grading tea means. Finally, after he has gained all possible knowledge about teas of various types he is permitted to taste but this does not mean that he is soon to get to the top. First he has to learn the actual taste of each grade and be able to recognize them when blindfolded.

It takes months of this type of training to enable him to judge by taste alone. He must be keen, too, because there are often as many as a hundred different "tastes" to be judged in a single day. Then, too, every tea is tested for other things such as general appearance, smell, result of steeping, and reaction to light. To understand this better let us visit a teataster's apartment.

This apartment is especially constructed with outside shutters that can be drawn or opened so as to let in the exact amount of light needed. Tables are in front of the windows and on them are arranged rows of small white cups and saucers, a set of scales an dlittle tins of "muster," as the tea samples are called. Beside each table is a large vase, used as a receptacle for the tea that is tasted.

A muster is picked up and some of the tea is poured into the hand. It must be absolutely free from vine dust, have small, tightly rolled leaves with a light tip here and there that is known as the "pekoe point." This is a small blossom and shows the taster that the leaves were picked while the tea plant was tender and before the leaves had begun to harden. Next, the sample is sniffed several times for the purpose of detecting the slightest hint of sourness indicating fermentation.

If this part of the test proves to be satisfactory, the next step is taken and this is known as the infusion of the tea. A small quantity is weighed very carefully, placed in one of the cups and covered with water that has been brought to just a boiling point. The saucer is set over it and the tea is left to steep while a five-minute-glass of sand is running out. This, like our old-time hourglass, is the method of timing used in tea testing. If any taint is detected in a sample, the lot from which it came is put aside to be sold as very inferior tea.

Now it is time fo rthhe teataster ot start his work. The sand has run out of the five-minute glass and the taster removes the saucer from the cup of tea. He takes some tea into his mouth, usually through a tube, and quickly rolls it around in his mouth, then ejects it into the big vase beside the table. He must not hesitate a second but has to give his opinion as to its grade. To hesitate and keep rolling that tea in the mouth would change its taste enough to cause a bad error of judgment and this would also taint the teataster's mouth so that his future judgment, that day, would not be reliable.

When one sample has been tasted and tested, work goes on with the next and the taster works for several hours until he feels that his mouth is getting tea conscious or tainted. Then he stops and another taster takes his place. The best teatasters cannot work for longer than a month because of the nervous strain and the digestion, for teatesting is very injurious to a taster's digestion. Each month of work brings him to where he must take a long vacation of from two weeks to two months in order to regain the best of health. He must also be careful not to catch cold or become ill in any way because tea cannot be properly taster by one who is not in the best of health.

It is easy enough for any person to judge, by the taste, and to distinguish between a very good tea and one that is very poor, but the teataster has to be able to tell very fine differences in teas, just as an artist can distinguish tones and shades of colors that the average person cannot see. There are at least a hundred different grades of tea and the expert is the one who has learned to recognize any of them. The apprentice starts with a few widely different teas and is gradually taught the secret of all. It is one of the most precious professions known to man.

The Way Out

The prophets of Israel were realists, but they were not pessimists. Take the darkest passages you can find in their writings. Though they unmask the injustices, idolatries, immoralities and hypocrisies of the nation, and leace no hidden thing untouchd, they end up on the note of hope and recovery. "There is a way out!" is their invariable cry. "It is God's way. It is costly. It runs counter to our pride. But it is sure. It will pay out." Thus the trumpet of alarm becomes the trumpet of assurance.—First Covenant Tidings.

WOMAN'S PAGE

KEEPING HOUSE

by Norma Crane

FAMOUS HOME ECONOMIST

HELPFUL HINTS: When Junior outgrows his playpen, use the pad to sit on at the beach or in the car when your bathing suit is wet____ with a generous length of thread keep several needles threaded in colors most often used. Leave needles in a pin cushion so that the threads will be untangled and always ready for use. Hang the pin cushion in a convenient place such as on the back of the kitchen door, ironing board, or sewing machine. You can tighten and replace buttons, mend seams and hems at a moment's notice. It helps stop an accumulation of unmended articles, too_____Here's something everybody will welcome: a set of six plastic tumblers with spill proof lids for use at picnics. The tumblers come in assorted colors and are imprinted with the words—sugar, butter, jelly, mustard, dressing, and ketchup.

RECIPE OF THE WEEK:

Jellied Tomato and Cottage Cheese Salad

1 envelope gelatin
1-2 cup cold water
1 can tomato sauce (1 cup)
1 cup cottage cheese (1-2 lb.)
2 tablespoons lemon juice
1-4 cup finely chopped celery
2 tablespoons minced onion
1-4 cup chopped green pepper
1-4 cup diced cucumber
1-2 cup mayonnaise
crisp, cold lettuce leaves
1 cup sour cream (1-2 pint)

Soften the gelatin in the cold water for five minutes. Bring the tomato juice to the boiling point and remove from the heat. Dissolve gelatin in the hot sauce. Stir in the cottage cheese and lemon juice until well blended. Cool. Stir in the celery, onion, green pepper, cucumber, and mayonnaise. Pour into individual molds or custard cups or 1 qt. mold. Chill until firm. Unmold on lettuce and serve with sour cream. Makes about 5 servings.

NOTES ON REFRIGERATORS: Never let the ice on the freezing unit of your refrigerator become thicker than 1-4 of an inch. If you do, you won't get the maximum efficiency from it____Wipe away spilled foods, sticky spots, and excess moisture at once to maintain a fresh and spotless interior and help prevent odors____Cover all dishes and containers to prevent loss of moisture, unless your refrigerator has a high humidity to maintain a fresh and psoles compartment____Plastic bowl covers and bags are very useful in keeping a tidy refrigerator; wax paper and tin foil are also good for helping retain moisture and flavor____A young couple should not buy a small refrigerator in the belief that two people do not need much storage space. In their first year or so, they will entertain frequently, giving dinner parties, having company, etc. This necessitates refrigeration of large cuts of meat, bottles, and other space consuming items. If marketing is done weekly or semi-weekly, ample storage space is desirable. And if the family increases, it may be necessary to get a larger refrigerator before there is an actual need of replacement.

MOTHER'S LITTLE HELPERS: A busy child is a happy child. Most mothers are busy. Why not combine the two to make most tasks more pleasant? A child can share in most of the housework, and is handy at running up and down the stairs. He may be clumsy at first but at least when he's working with you, he's present and accounted for. His help relieves you of anxiety concerning his whereabouts and safety. Let your child perform tasks with you. It's a wonderful opportunity for those "heart to heart" talks which solve many little problems and bring you closer together. You'll get many a chuckle in later years when you look back on some of these discussions and situations.

PICNIC BUNS

1 cup milk
1 yeast cake
1 tbsp. sugar
¼ cup scalded milk
1 tsp. salt
5 tbsp. fat
4 cups flour

Scald milk. Dissolve yeast cake and sugar in one-fourth cup scalded milk cooled to lukewarm temperature. To remaining three-fourths cup milk add salt and fat.. Combine mixture and add flour, beating in electric mixer. If dough is to be used immediately, turn out on floured board and knead, adding necessary flour. Then form into rolls and allow to double in bulk. Bake. (If dough is to be stored in refrigerator, cover with waxed paper after adding first four cups of flour and store.) For buns, make into finger shape, allow to rise and bake twenty minutes at 425 degrees.

Frankfurt-Potato Boats are a new and flavorsome departure. Serve them with garden-fresh green beans, golden corn bread squares, a crispy salad and a favorite dessert.

FRANKFURTER-POTATO BOATS

1 package frankfurts (1 pound)
4 medium sized potatoes
Salt and pepper
2 tbsp. butter
¾ cup hot milk
½ cup grated pimiento cheese (⅛ pound)
Paprika

Cook potatoes in boiling water until tender. Drain and replace pan of potatoes over low heat to dry potatoes well. Shake pan frequently to prevent potatoes sticking. Mash potatoes until free of lumps. Add salt, pepper, butter and cheese and combine thoroughly with potatoes. Add enough hot milk to make light and fluffy. Beat very thoroughly. Slit frankfurters lengthwise but do not cut entirely through. Put frankfurters on baking sheet. Fill with mashed potatoes. Sprinkle with paprika and broil until potatoes are golden brown and frankfurters are heated through.

SPAGHETTI SALAD

¼ pkg. spaghetti
2 hard-cooked eggs
½ cup nippy cheese
Cut in cubes
2 peeled and chopped tomatoes
1 boiled potato
½ cup chopped celery
1 tsp. onion juice
1 chopped pimiento

Break spaghetti in small pieces; boil in salted water until soft. As soon as tender, place in a bowl of ice water to bleach. When cold, dry on soft towel; mix with other ingredients.

BETTER MENU RESULT OF CONTRAST

Contrast in texture, color and flavor should be remembered in planning menus. If the main dish is soft-textured, for instance, see that there is crisp contrast in an accompanying salad or relish. Vary the colors — green snap-beans, stewed tomatoes and mashed potatoes make a more pleasing combination than sliced beets, stewed tomatoes and carrots. When it course, for instance, don't serve same food on the same menu twice—if tomato soup is the first course, for instance, don't serve tomato salad.

CHEESE SOUFFLE

1 cup milk
3 tbsp. butter
3 tbsp. flour
½ tsp. salt
1 cup grated cheese
3 egg yolks
3 egg whites
¼ tsp. pepper.

Make a white sauce of the first flour ingredients. Add egg yolks and grated cheese and cook until the cheese melts.. Cool slightly. Beat egg whites stiff. Fold into the cheese mixture. Pour into greased pan and bake.

CHEESE STRATA

12 slices bread
¼lb. American cheese
2 2-3 cups milk
4 eggs
2-3 tsp. salt
⅛ tsp. pepper
Paprika

Trim crust from bread, arrange six slices in bottom of buttered baking dish. Slice the cheese and place on bread; cover with remaining slices of bread. Beat eggs slightly, add milk and seasoning. Pour milk mixture over the bread. Cover and keep in the refrigerator until ready to bake. Bake and serve at once. The bread should puff up and brown. The thorough chilling makes the strata puff like a souffle.

CHEESE FONDUE

1 cup milk
1 cup soft bread crumbs
1 cup grated cheese
½ tsp. salt
¼ tsp. pepper
1 tbsp. butter
3 egg yolks
3 egg whites

Scald milk and add to the bread crumbs. Cool slightly, add the cheese, butter, salt and egg yolks. If not ready to bake, cool, cover and place in refrigerator cabinet. When ready to bake, fold in stiffly beaten, egg whites, pour in buttered baking dish and bake. Serve with mushroom sauce. Garnish with parsley.

CHEESE PUFF

½ lb cottage cheese
4 eggs
1 tbsp. butter
Salt and pepper

Whip eggs light. Add salt and pepper and fold in cheese. Pour into buttered dish. Bake in hot oven until puffed. Brown and serve hot. Serves four to six.

One of the fine attributes of cheese is that it conbines well with nearly any food. Here are a few ideas that you might enjoy on your spring menus. Tuna Fish Puff is one. This dish combines cheese and fish in a substantial main dish that needs only a vegetable salad to complete a meal.

CHEESE FRITTERS

Mix two tablespoons of flour, yolk of one egg and enough sweet milk to make batter. Add a pinch of salt and pepper, two tablespoons of grated cheese, and beaten white of egg. Beat well. Drop in small spoonfuls into hot fat in skillet and fry on both sides to a nice golden brown. Serve very hot.

WELCH RAREBIT

1 cupt cheese
2 eggs
½ tsp. mustard
1 cup bread crumbs
1 tbsp. melted butter
Salt and pepper

Grate cheese. Add bread crumbs and eggs beaten light. Add butter and seasoning. Put on slices of toast. Place in oven to melt cheese and set the egg. Serve hot. Serves four to six.

TUNA FISH PUFF

4 tbsp. butter
½ lb. sliced mushrooms
4 tbsp. flour
1 tsp. salt
Few grains cayenne
4 eggs, separated
1 cup freshly grated American cheese
1 7-oz can flaked tuna fish
2 cups fresh bread crumbs
1½ cups milk

Melt butter in saucepan, add mushrooms, cover and cook five minutes over low heat, stirring occasionally. Remove mushrooms. Add flour and seasonings to butter left in pan, blend. Gradually add milk, while stirring; cook over low heat until smooth and thick, stirring constantly. Beat egg yolks slightly; add some hot sauce and blend; return to remaining sauce and cook two minutes longer. Fold in grated cheese. Remove from heat. Add drained, flaked tuna, mix thoroughly. Cool. Beat egg whites until stiff. Fold in fish mixture. Pour into six large buttered, custard cups or individual casseroles. Bake at 325 degrees F. 45 minutes or until firm. Serve with lemon. Serves six. For a large casserole, bake one and one-fourth hours.

Cheese certainly has its way when it comes to adding zip and taste appeal to bland tasting vegetables. Many people, who do not otherwise enjoy carrots, asparagus, cauluiflower or the like find pleasure in any vegetable when served in casserole with cheese sauce. To make cheese sauce for vegetables, add one cup grated yellow cheese to two cups medium thick cream sauce. Heat in double boiler.

GREEN BEANS IN CHESSE SAUCE

4 cups cooked green beans
3 tbsp. butter
3 tbsp. flour
½ cup grated American cheese
Salt and pepper to taste
2 cups milk

Melt butter in a saucepan. Add flour and blend. Add milk and cook, stirring until smooth. Add cheese and seasonings and blend. Combine with drained green beans. Heat thoroughly and serve. Serves six.

STEAMED BROCCOLI WITH CHEESE SAUCE

1 bunch broccoli
Salt
Boiling water

The broccoli may be prepared for cooking and stored in the refrigerator. Cut off the large outer leaves and tough portions of the stalk. Cut into suitable sized pieces. Place in boiling salted water and cook until just tender. Drain. Serve hot with smooth cheese sauce.

TENDER COOKIES

If a refrigerator cookie dough seems soft, resist the temptation to add great quantities of extra flour to it. Moderately soft doughs make delicate, tender cookies. Chilling the dough makes it easy to handle.

ASPARAGUS WITH LEMON SAUCE

20 to 24 stalks of asparagus
4 tablespoons butter or margarine
2 tablespoons flour
1 cup milk
3 egg yolks
½ teaspoon salt
Juice of one lemon

Wash asparagus, removing scales on stems of stalks. Cook in boiling salted water until nearly tender. Drain. Make a sauce by adding flour to melted butter, then remove from stove while milk is added. Stir constantly. Replace on stove and cook until thick and smooth. Add sauce to beaten egg yolks, then cook for 1 minute, being careful not to let the egg overcook. Add salt and lemon juice. Serve over asparagus stalks.

PEACH MOUSSE

1½ cups mashed peaches
½ cup sugar
1 2-3 cups evaporated milk (1 tall can)
2 tablespoons lemon juice

Prepare milk for whipping by chilling in refrigerator tray until ice crystals form around edges. Select ripe, fine-flavored peaches. Peel and stone. Mash with a fork or potato masher. Add sugar and stir occasionally, until it is dissolved. Whip milk very stiff in cold bowl with cold beater. Fold in lemon juice, then lightly fold in the sweetened peaches. Pour at once into cold freezing trays and freeze in regrfigerator set at coldest point. Yield: 3 pints.

A "BOILED" DINNER

2 or 3 pounds pork spareribs
1½ cups hot water
4 medium-sized potatoes, pared and halved
1½ cups canned or cooked green beans and liquid
Salt and pepper

Brown spareribs in frying pan without added fat. Add water and simmer about 1 hour. Add potatoes to meat and cook until tender—about 25 minutes. Add beans and liquid the last 10 minutes of cooking. If raw beans are used, add with potatoes. Season with salt and pepper. Skim off excess fat before serving.

To Complete the Meal

Serve with crisp lettuce, tomato, and celery salad, and apple betty with lemon sauce for dessert.

For Variety

BEEF SHORT RIBS may be used with longer cooking.

CORNED BEEF, HAM HOCK, OR HAM BONE may be used in place of the spareribs. Cover with water and simmer about 3 hours or until tender. Omit salt, and continue as above. Good with sauerkraut.

A VARIETY OF VEGETABLES may be used in a "boiled" dinner. In addition to potatoes, use onions, large pieces of carrot, and wedges of cabbage. Add cabbage about 20 minutes before serving, as it cooks more quickly than the other vegetables.

One for the Book

The oil industry of the United States is breaking all records in supplying our country with petroleum products.

Thirty-four thousand companies are doing the job. Last year 33,098 new wells were drilled and the total production of crude oil reached an all-time high of over 77 billion gallons. This will be exceeded in 1948.

Even in the face of such an output, a proved reserve of a trillion gallons of oil is available in the ground.

But all this does not mean we can afford to waste oil. We should use petroleum products as efficiently as possible, thus doing our part to conserve supplies.

Highly taxed private enterprise has given our nation the cheapest and best oil supply in the world. Every owner of an automobile or oil burning equipment would better appreciate this if he lived in a country where oil is a luxury.

Rev. and Mrs. J. L. Hocutt of Middlesex N. C. Enjoy New Home

250,000 Rurual Women Observed National Home Demonstration Week

Washington, D. C.—
Approximately 250,000 rural colored women took part in the observance of National Home Demonstration Week, May 2-8, by reviewing their past achievements and making plans for future home improvements, says N. L. Wilson, director of Extension Service.

Highlights of this year's observance were a series of home tours, group discussions, luncheons, and radio broadcasts in which 3,500,000 rural women participated. Of this total, 250,000 were rural colored women in the 17 Southern States. Their program was focused on the achievements of home demonstration work.

Reports received by the U. S. Department of Agriculture from State Extension Services showed that rural colored women carried out extensive home improvement practices last year under the leadership of home demonstration agents and volunteer neighborhood and community leaders. Organized in 6,000 home demonstration clubs, they canned 30 million quarts of fruits, vegetables, and meats, and stored an additional 20 million pounds of foodstuffs.

Other achievements of rural women under the guidance of home agents and volunteer leaders last year included improving the diets of their families, refurnishing some of the rooms in their homes, and making-over garments. Reports show that home agents assisted 156,000 rural colored families in improving their diets, 30,000 in constructing or repairing their homes, 6,000 in obtaining electricity, 191,000 in improving their food preservation methods, 73,000 in making neater garments, and 46,000 in planning and carrying out recreation activities.

However, in line with this year's observance theme, "Today's home builds tomorrow's world," home agents increasingly are extending their work program beyond the mere physical house and its furnishings to the people themselves who live in the homes. For example, last year they assisted 30,000 rural colored families with child-development and guidance problems, and 36,000 with family relations problems.

T. H. Campbell, field agent who has been in extension work for 42 years, says that a good home demonstration agent must not only be a capable home economist, but she must also be a psychologist and a social worker.

While home agents usually carry out their programs through home demonstration clubs with which they meet monthly, some of their most important work is achieved through individual home visits. Last year, the 389 colored home agents and supervisors on the State Extension staffs made 135,000 home visits to assist rural family relations problems. Additional home visits were made by the 30,000 volunteer neighborhood and community leaders.

Home demonstration work is over 30 years old, having been authorized by the Smith-Lever Act in

Wake County Farmer Profits From Turkeys Amounted to $1246.21

Washington, D. C.—"I believe this turkey business is going to answer my tobacco acreage cut", says Leo Pryer, Wake County Negro farmers of Route 1 Garner, while talking to W. C. Davenport, Negro County Agent of the State College Extension Service, recently.

Pryer started a demonstration with 200 turkeys, losing only 30. The 170 birds were properly fed and cared for until they reached an average weight of 19 pounds at a cost of $3.60 per bird or $613.00 which left a net profit of $633.21.

In order to further reduce the cost of the second flock of turkeys, Pryer is producing more small grain and pasture range.

"If I continue to be successful this thing will help me in more ways than one," says Pryer.

2-Year-Old Cow Brings $1,325 in Stirton Oman Sale

Faithful Design Blond, a two-year-old cow, sold for $1,325 in the Stirton Oman sale of Crieve Hall Jerseys at "Ashlawn" farm in Williamson County yesterday. She was purchased by H. Wilson of Murfreesboro, who paid $925 for her daughter.

The top priced animal was sired by the famous Faithful Design 2nd, one of the better animals of the breed. With a record of 472 lbs. of butterfat as a two-year-old, she was officially classed excellent in a recent classification of the Oman herd.

The 66 cows and heifers sold averaged $347, Oman said this morning. He said while many of the purchases were made by out-of-state breeders a greater portion of the group was bought by Tennessee breeders.

Gov. Jim McCord one of the many distinguished guests who attended the sale, said the Crieve Hall herd represented the better breeding in the Jersey world.

Oman, who purchased the herd a year ago, plans to continue the breeding program initiated before the death of Herbert Farrell, the former owner and founder of the Crieve Hall herd.

Modern, Comfortable Home of the Hocutt Family

From a three-room tumbled down shack to an eight-room modern farm dwelling is the home improvement progress of the Reverend J. T. Hocutt of Middlesex, Route 1.

Sixteen Counties Of Northeastern District Of North Carolina Represented

Washington. D. C.—4-H Club members from each of the sixteen Counties in the Northeastern District of North Carolina assembled at the 8th Street High School Washington, N. C., last week for the fourth annual District 4-H Club Federation meeting. Highlighting the program were the Boys' Judging Contest.

The Hertford County Boys' Demonstration Team, composed of Samuel Riddick and John H. Bishop presented a demonstration on "Growing Pastures in Eastern North Carolina; placed first in this event and will represent the Northeastern District in this event in the 4-H Club Short Course at A. and T. College, Greensboro, North Carolina this month. The Boys' Team from Perquimins County composed of James Johnson and Leroy Coleman placed

Death Rate on Farms Double That of Non Agricultural Workers

Chicago, Ill.—Farm workers, colored and white, had an accidental death rate twice as high as workers in non-agricultural industries in 1947, the National Safety Council reports, this week.

The 1947 death rate for farm workers was 52 per 100,000 workers, while in non-agricultural industries the death rate was 26.

The high farm work death rate gave added significance to Farm Safety Week, proclaimed by President Truman for July 25-31, which seeks the elimination of at least 30,000,000 farm hazards. Each member of a farm family was asked by the President to accept personal responsibility for the elimination of at least one source of accidents during the week.

19,500 FARM RESIDENTS, COLORED AND WHITE, DIE

Other highlights of the Council's annual farm accident report were:

1. Total farm residents deaths were 19,500, about the same as last

Running Water And Electricity Will Be Added Shortly

Middlesex, N. C.—In the fall of 1945 Hocutt began to cut logs from his farm forest and later secured a first-class carpenter to start work on his eight-room dwelling following plan No. 5545 which was secured from the agricultural engineering department at State College in Raleigh.

The process was slow since he did not get enough lumber from his forest to build the house and had to take chances of obtaining a little from various mills.

Recently Reverend Hocutt and his family of twelve moved in under temporary conditions, the house wired for electricity and definite plans to put in running water within a few months. "Moving from a shack to a new home is like going to bed wanting something real bad, and waking up finding it," declared Hocutt, who estimated that if he had had to buy all the lumber and pay for all the labor his new home would have cost him more than $7,500.

The eight-room modern dwelling is the new home of the Hocutt family. The house has been wired for electricity, and plans have been made to include running water and landscaping within the next few months. The Negro county and home agents worked with Hocutt in the improvement program.

Farm ownership among Negroes in Johnston County has more than doubled from 1940 to 1946 and Negro 4-H membership from 1943 to 1947 almost tripled under the guidance of L. R. Johnson and Mrs. Lucy O. Toole, county Negro farm and Home Agents, respectively.

Only 150 Negroes owned farms in Johnston county in 1940, but the number has reached 348 in 1946, according to the county auditor's reports.

Four-H membership among the Johnston Negro boys and girls has jumped from 324 in 1943 to 825 in

Farmer Improves Land by ---- 13

Dr. Arthur Raper Stresses Growing Importance Of Cooperatives

Washington, D. C.—
The growing importance of cooperatives to small farmers was emphasized by Dr. Arthur Raper, social science analyst of the U. S. Department of Agriculture, in an address recently before a record audience of 2,500 Virginia colored farm people in their annual farmers' conference at Virginia State college, Petersburg, Va.

Other speakers on the one-day conference program were: Dr. L. H. Foster, president of the college, L. B. Deitrick, State Extension Service director, John W. Mitchell Extension Service field agent, Miss Janet L. Cameron, State food and nutrition specialist, and three farmers—Lee Winston, Otis Scott, and Lloyd Forest. Dr. John L. Lockett, director of the division of the college, and Rosa W. Newsome State agent of Extension Service presided.

Dr. Haper, who is author of "Preface to Peasantry" and "Tenants of the Almighty," pointed out in his address that only through cooperatives could most small farmers afford heavy farm machinery such as tractors and combines. This means, he said, that if small farmers plan to compete with large operators, they cannot

PICKING DAISIES TAKES A TOLL

Poison Ivy Plus Bugs and Bulls Put Farm Work at Top Hazard

Washington — (AP) — So you want a nice, safe place to work. Well, sir, choose a job making explosives, playing around with dynamite and such. You'll probably live to a ripe old age.

But if you are the thrill-seeking type, settle down on a farm.

It's going to be hard to make you believe this unless you're up on your statistics—but a farm is just about as dangerous as a buzz-saw.

The agriculture department says 4300 people were killed in farm work accidents last year.

President Truman proclaimed July as National Farm Safety Week.

Many Needless Hazards

He says there are many needless hazards on American farms. He asks each member of each farm family to eliminate at least one of these hazards during the week.

If this is done, the whopping total of 30,000,000 hazards will be erased.

What are the farm hazards?

Everything from rattlesnakes to mean bulls, from bug poisons to poison ivy, from pop guns to dynamite, from mowers to bathtubs. Even picking raisies has its hazards. Down on that quiet little farm of yours nearly everything you touch can turn into a deadly weapon under certain circumstances.

The safety council of the department of agriculture found so many hazards that it published a 32-page pamphluet (Miscellaneous Publication No. 608 USDA) describing farm accidents and how to avoid them.

Farmer Tops List

This pamphlet says more people are killed in farm-work accidents than any other industry. Of course more people are engaged in farming than other occupations. But even when figured on the individual's gamble against death, the farmers stand close to the top of the list.

The deaths per 100,000 coal miners, from accidents, were 249 last year. Farm experts say if it were possible to figure farm deaths on the same basis, the figures would show farming to be just about as hazardous as coal mining, on a man-for-man comparison.

The bureau of labor statistics (BLS) says the manufacturers of explosives is a comparatively safe occupation, contrary to popular opinion. It is near the top of the list of the bureau's industrial accident safety sheet. One reason of course, is that explosives people know what they're up against and take the greatest precautions.

Any job that has a buzz saw connected with it—such as saw and planing mills and sawmills—rates near the bottom.

The greatest increase in farm machinery—and more modern plumbing, like the bathtub—have added to the roll of accidental deaths down on the farm. Machinery is at the top of the list of all causes, the USDA accident pamphlet says. Modern plumbing causes deaths from falling in slippery tubs and occasionally from electrocution—people standing in water and touching electrical outlets.

Livestock—mean bulls, runaway horses and the like—also are a major cause of deaths and accidents. Other deaths are caused by falling into wells, cisterns and pits and from roofs and ladders. Lightning takes its toll. Many farm people drown. Other mishaps come from accidentally drinking or eating bug poison; gunshot wounds and fires.

John H. Wetzel, chairman of the national farm safety week committee wanted a close-up view of farm accidents in the hope something could be done about eliminating them wholesale. He asked farm people to write about their mishaps. Here are some of the letters:

"I am Ruth Harris of Cheyenne, Wyo. I rode after the mail on horseback. It was raining.------

"I had ridden one mile and the next thing I knew, it was three days later. I was lying in bed sick and unable to hear. Mother wrote on a blackboard that I had been struck by lightning. The horse was killed----------

"It was over a month before I was leading a normal life."

From James Ryburn, Rockwell, Iowa:

"I went to the barn after breakfast to clean the bull's stall. I untied him but neglected to put the staff on him.--------

"I was tying him when he attacked me. The first time he hit me he broke four ribs, then my collar bone, he also knocked out four front teeth and cut my lip----

"The last time I recall he caught me up with his horns and tossed me in the manger which saved my life."

Gertrude Humphrey, Seattle, Wash.:

"My step-sister's husband was using our team and moving machine to cut the neighbor's hay on a rough hillside.

"He was wearing a heavy ring. He walked out on the tongue to slap a horse-fly. The horse jumped. Sam fell in front of the sickle and it passed under him but his ring caught on a sickle guard and he was dragged all over the 40 acres-------- The doctor had to strip most of the flesh from his arms to free them of dirt and grass --- He is crippled for life."

Prevention First

There is a great deal of public misconception concerning flood damage and flood control, which has largely resulted from the organized campaign on behalf of great, enormously costly, multi-purpose dams, such as those built by TVA and proposed for various other river basins.

Recently an analysis was made of the problem, based on surveys of the U. S. Department of Agriculture. It produced these remarkable facts: 15 per cent of the damage occurred in urban areas, generally far downstream; 6 per cent was agricultural damage along the main stream; 4 per cent was agricultural damage along principal tributaries—and 75 per cent was damage, mainly agricultural, in the headwater valleys. And nearly all the damage in headwater areas is the result of erosion and small and frequent floods, where the big dams offer no protection.

What this means is that the big main-stream dams can at best, do only a very small part of the flood control job, in spite of their incredible cost in money, labor and materials. Control in the headwater valleys is principally a matter of soil conservation The land must be worked and ploughed in a fashion that will keep the topsail from being carried away when the water comes. In this connection, it is a fact that in areas we believe primitive, such as Guatemala, the Indians of the region have long practiced sound contour cultivation though they have only hoes for tools.

Flood control, therefore, isn't a matter of big appropriations of tax money for huge dams. It lies in intelligent work being done on the individual farms of the nation, and in controlling the flow of water in small streams. The heart of the problem is flood prevention rather than control, after the bulk of the damage has been done.

Cotton Insects

Are you planting cotton this year? Records show that cotton insects destroy one out of every seven bales produced in Alabama. The best cotton insurance that can be bought is 60 pounds of poison for each acre of cotton.

Calcium arsenate gives good control of the boll weevil. If this material is to be used, buy 30 pounds to calcium arsenmate with two per cent nicotine for each acre. These materials will control only the weevil and lice.

Choctaw County Farmers Will Grow Peas for Canning Plant

Choctaw County Alabama farmers get extra cash income from growing brown sugar and Crowder peas. The fieldman for a large canning concern in the area met 62 farmers at the Community Center in Lisman on March 27 to explain the Pea Program.

About 10 days of labor, 200 lbs. of phosphate 100 pounds of a complete fertilizer and 20 pounds of seed peas will do for one acre. This amount to about $10 needed to produce an acre of peas. A visiting farmer from Mississippi said he had cleared $70 on one acre. He stated that for midsummer cash money the project is tops with him and his neighbors.

Farmers attending the meeting signed up to grow 204 acres this summer. Others are signing up to grow up to 5 acres each.

Pest Control Easy

The control of diseases, worms and bugs in the garden has been made easy. There is now a garden dust on the market that will control most of these troubles.

This dust has one per cent rotenone and five per cent Z-78. This is one of the new remedies to prevent or check the spread of plant diseases. Several companies are putting this spray dust on the market.

Care Cuts Pig Losses

Hog growing in Alabama is big business. Thousands of hogs go to the market every year. More thousands go on the tables of Alabama people. For every six pigs going to market four other pigs have died before getting that far.

Most of the pigs from the spring litter will be ready for weaning at eight weeks of age, this month or next. Extra care to prevent losses will save high-priced feed. It will also make money for the farmer, and provide more meat for hungry people.

A few days before the pigs are weaned the sows feed should be reduced. The sow should be taken away from the pigs. The pigs should not be taken away from the sow.

Sows usually will breed within a few days after pigs are weaned. Both sow and boar should be in good condition. To get them in good breeding condition graze them on alfalfa, crimson or white Dutch clover. Feed a little more tankage mixture. Feed them a lemited amount of corn.

What Fire Insurance Can't Do

The President of the National Board of Fire Underwriters has taken issue with the idea that the phenomenal rise in fire losses has been entirely due to inflation, and that "real losses" have been going down. According to him, the number of fires has increased, the number of claims has increased, the number of conflagrations has increased, and the number of catastrophies has increased.

Fire insurance has cushioned the shock of fire for millions of people. But fire insurance, vital as it is, cannot perform miracles. It can pay us money if our property goes up in smoke. But it cannot restore a human being who is burned to death. It cannot recreate materials which have been turned to ashes. It cannot provide jobs for people who are thrown out of work when a factory turns into a huge torch. It cannot give us back keep-sakes and possessions whose extrinsic value far outweighs their intrinsic value, it cannot find homes for the homeless.

Inflation as represented by higher replacement costs and claims, ha been an influence in sending fire waste to record levels. But the fact that we are having more and more fires, both large and small, proves that the human factor is still the biggest thing. It is the same old story—carelessness, indifference, and downright ignorance are fire's most productive friends.

No one can prevent fire for us —no one else can keep a constant eye out to see that our property is safe. That truth is the heart of the fire prevention problem.

Fire Hazard

Continue to get rid of fire hazards in and around buildings. Put out all fires in woodlands, pastures and wildlife areas.

CHOICE WORSHIP SERVICES AND PLAYS

A book that fits in with the urgent needs of the present day. Written by various authors familiar with church requirements. Among its contents are several choralogues: The Woman at the Well; The Nativity; The Prodigal Son; etc. Tribute to the Rural Church is a beautiful tableau. The Little Church of Childhood is a plea for the continuance of the rural church. The Melting Pot is a patriotic number climaxing with the church's contribution to the country. Others are for Lord's Day observance and general occasions. A valuable book. 40c.

PLANS AND PROGRAM BOOK

Here is a collection that will provide an abundance of program material to those entrusted with the responsibility of preparing suitable programs for socials, Sunday School entertainment, Young People's Societies, etc. It is a book for many occasions and contains 142 pages

Price 60c per copy

Grass Study Promises Hope for Millions of Acres

By Robert E. GEIGER

Washington — (AP) — Grass ___ It fattens cattle. Sheep thrive on it. The welfare of millions of Americans depends upon it.

Grass_____

Man in his quest for dollars or happiness frequently need look no further than the roots of this grass under his feet.

So says the new Yearbook of the United States department of agriculture, written by some of the world's best known farm scientists and published yesterday.

The grass-farming idea has swept the world, says the book, because grass refreshes the soil. After grass is grown a few seasons and then plowed under, other crops thrive.

Brings Nitrogen

That's because grass brings nitrogen—needed in abundance by growing things into the soil. Its dead leaves and roots produce organic materials—also needed in large quantities by other crops. They make the soil a better seed bed.

Grass farming is complicated. Charles E. Kellog, chief of the bureau of soil survey, says it isn't adaptable to all U. S. soils, especially not in wet, hot regions. He says the individual farmer has to study his land to determine whether he will be benefited or harmed by grass rotation. And he must know how to rotate crops.

The book points, as one great grass-farming possibility, to the great plains county that stretches from Canada to Mexico east of the Rocky Mountains.

Soil Blew Away

Nearly everyone knows the story of how the white man went west and plowed under millions of acres of the "short grass" that grew there. Then drought came and the soil blew away in great, terrifying clouds.

Some farmers despair of ever getting back a grass cover to hold their lands.

Now the scientists disclose that native grasses—the famed buffalo grass and blue grass, as well as eultivated grasses—can be grown again on the plow-scarred acres. Not only will they grow again, they apparently grow better than ever before on the plowed lands. Thus it seems possible to reeonstruct the "short grass country" with all and more of the greenery it had when the Indian knew it.

Working 10 Years

Farm scientists have been working more than 10 years, since the dust bowl era, to do this.

They searehed the earth for new grasses. What they wanted was a grass like the buffalo grass that produees some of the fattest cattle in the world. But they wanted a grass easier to harvest and even more resistant to drought.

To date they have found nothing more promising as a permanent cover than the buffalo and other native grasses. What they have done is to improve methods of harvesting and growing these native seeds.

The problem was to adapt farm machinery to the job of getting down close enough to harvest the seeds in the low-growing grass. A machine was developed to do this.

It was found the seeds didn't germinate at a high rate. It was discovered that chilling the seeds speeded and increased germination.

Millions of Acres Reseeded

Several millions of aeres have been reseeded. In places reseeded land withstood dust-producing storms better han oher land upon which grass has grown since Indian days.

The Yearbook says:

"Every reseeded pasture on the United States southern plains experimental range near Woodward, Okla., has supported many more cattle and produeed much greater total liveweight gains than the native range."

Many farms were abandoned during the dust bowl drought. Soil experts estimate it might take as long as 30 years for natural grass to recover on some of them. But in experiments native grasses have been brought back on some other abandoned lands in two and three years.

Big Job Remains

Farmers and scientists who have been wrestling with the problem concede a big job remains to be done. For one thing it is estimated more than 80,000,000 acres should be reseeded. This is a big and expensive job unless new methods are devised.

Airplanes have been tried. In Montana one range was reseeded by scattering seed from planes at a cost of only $1.20 an acre. But airplanes can be used only where conditions are near perfect for the seeds to grow.

Nearly all effort has been toward re-establishing permanent grass pastures on abandoned lands. The experts believe it also may be possible in some parts of the great plains, to rotate permanent grass pastures with field crops every few years.

But man himself seems to be the key to the question whether the dust bowl will return, the Yearbook hints.

Larger Ranches Needed

It suggests ranches must be larger, but fewer, even though many of them now contain more than 1000 acres.

When ranges are overstocked with cattle, the grasses are harmed or destroyed.

But if fewer cattle are pastured on the range it won't mean less money for farmers, the experts believe.

They say experiments have shown that if the number of cattle is balanced against the grass the animals get fat faster and produce the biggest profits. The rancher must keep a reserve of grassland and hay and at the first sign of drought market enough animals so the rest have enough to eat.

In the range area of the northern great plains it is estimated 20 per cent of the land that was in crops in 1939 should be put back in grass.

Veteran Journalist Urges Young Negroes Into Field

Chicago—Pointing to the increasing employment of Negroes on the editorial staffs of white newspapers as well as the improved quality of Negro newspapers as a whole, veteran journalist George S. Schuyler writing in November Negro Digest urges interested young Negroes to get in on the ground floor of this more fertile than ever field.

"After all," Mr. Schuyler says, "editors, white or colored, are out to increase sales and if the work of a reporter or feature writer will increase sales, they will buy it and are more willing to give him a steady job."

Giving an account of his own apprenticeship and progreess in journalism in this article, another of Negro Digest's "Future of Negrow Youth Series," Mr. Schuyler deelares:

"There is no doubt that apprenticeship around a newspaper plant or editorial office is the best preparation of all, and after leaving school the young man or woman eager to enter the field should enter any job obtainable in a newspaper plant."

Commenting on incresed opportunities in the field, the veteran editor says:

"Negro publishers are bringing out better papers with the result that the Negro journalist must be able to measure up to the best there is in the field, white or eolored. This automatically opens up both fields to him.

"Moreover," he adds "the experience and contacts gained in journalism offer many new opportunities. And newspapers are only a part of journalism. Other outlets include public relations, radio, free lance magazine writing and ghost writing all offering bright futures for interested, alert, eager young Negroes."

U. S. Expands Research of Foot Disease

In an expanded program to prevent the dreaded foot and mouth disease from entering the United States and in an effort to discover means by which the disease might be prevented, a research laboratory will be established on Prudence Island located off the coast of Rhode Island, Dr. B. T. Simms, chief of the Bureau of Animal Industry of the U. S. Department of Agriculture, announced recently.

Congress recently authorized the department to set up a research laboratory on an island not connected to the mainland. This was specified to guard against spread of the disease.

Prudence Island, in Narragansett Bay, was described by Simms as ideal for the department's purpose. An isolated spot had to be chosen because foot-and-mouth disease is highly contagious.

Simms told a news conference that cattle in Massachusetts and on Long Island will be in no danger.

"If I owned cattle there I would be more afraid of infection arriving by plane from some other country," he said.

Elaborate precautions will be taken to prevent the disease from escaping from the laboratory. No animals will be kept in the open and the sewage and even the outgoing air will be sterilized, he explained.

The laboratory will be the largest and most complete of its kind in the world and will be staffed by at least 300 employes. The department will now have to go to Congress for an appropriation to start the work. Buildings and research facilities will probably cost from $25,000,000 to $30,000,000 Simms said. Annual operating expenses will run from $2,500,000 to $3,000,000

"But this is a very small proportion of the cost to the country that would result from the establishment here of the disease," Simms said.

The United States spent $35,000,000 last year trying to help Mexico stamp out the disease there. After 1,000,000 cattle were slaughtered the program was stopped at Mexico's request.

Slaughter and burning or burying diseased cattle, presently is the only known remedy to eradicate the disease.

Save the Forests

This spring, the State Foresters and the Forest Service of the Department of agriculture are eonducting a national program to reduce forest fire losses. And that campaign can be a success only if the public is made aware of the problems and how to deal with it.

Fortunately, some progress has been made in dealing with the forest fire menace. In prewar years, we averaged 210,000 fires in our forests, woods and range lands. Since the war, the number has dropped, and was 172,000 in 1946. But no one should accept these statistics as an indication the waste is unimportant. Last year, forest fires burned enough trees of sawtimber size to build 86,000 5-room homes; and enough pole sized trees to provide a 12-month supply of newsprint for every newspaper in this country.

What causes forest fires? The experts have the answer to that, based on years of correlated experience. Only one in a hundred is the result of explosions sparks from machinery, etc. A very few are the handiwork of arsonists. Less than ten per cent are started by lightening. And here is the big point: 90 per cent are caused by people—by the carelessness of the campers, hunters, travelers, loggers, farmers and the others who live in forests, who work in them, or who visit them.

During the campaign, these and many other facts will be made available. Forest fire prevention—like any other kind of fire prevention—isn't a job for the other fellow." It is a job for you.

Seven Negro Farmersof Pender County Form Tractor Organization

In an effort to compete with larger farmers in reducing labor costs, and to increase the efficiency of production, seven farmers of Newkirk Chapel Community of Pender County formed a Tractor Organization.

These men put from $100.00 to $275.00 each and made the down payment on $3,000.00 tractor, equipped with a heavy bush and bag disk harrow, hammer mill and other attachments. The organ ization has employed a man to operate and maintain the tractor and to develop a farm by farm schedule of operation with tractor power. Organization members have agreed to pay $3.00 per acre for land disked: non members shall pay $3.50 per acre. All money will go into treasury to pay the notes on the tractor and to cover cost of operation and maintenance.

The officers and members of the organization are as follows:

Manager, Willie Pearsall.

Assistant Manager, J. A. Fennell.

Secretary-Treasurer, A. J. Herring.

Supervisory Committee, Rev. J. W. Williams, Willie Murry, Oscar Barben, James Bonnie.

Roosevelt Newkirk a 4-H member of Pender County Won second place with a grade Heifer at the Southeastern District Junior Dairy Show . held at Fayetteville, N. C., which he spent a good amount of time training to lead and fitting the animal for the show.

Farm Talk with Farm Folk

By Jesse Safley

Albert Miller is a farmer in the Sango Community of Montgomery County and instructor of a veteran farm trainees class. A graduate of the University of Tennessee College of Agriculture, he has a wife and two small children, and like many other Montgomery Co. farmers, produce tobacco, corn hay and various types of livestock. He is also president of the Sango Community Improvement Club and a leader in other civic programs.

All in all, he's just an average good American farmer who works hard day after day at doing his best to make a comfortable living for his family.

At least, he did work hard up until a few days ago when he was confined to a small bed in the Clarksville hospital just because he like so many other farmers, took a chance and lost.

Miller, along with two other men, was pulling the pipe from a farm well. Above their heads were electric wires. They discussed the possibility of removing the pipe without allowing it to come in contact with the "hot wires." They decided to try it. Their minds filled with the task of removing the pipe they more or less forgot about the wires. The pipe was flexible and the higher it got into the air the more difficult it became to hold it erect.

Then all of a sudden, the pipe touched the wire, Miller tumbled from the conerete wall on which he was standing, and onto the ground. He was severely burned. Luckily the men assisting him were not injured.

The burns have caused Miller much suffering, expense and loss of time from his job at a period when work is most rushing, but he will be able to return home within a few days. However, it will be some time before he will be able to go back to work.

This story is not so different from numerous others about accidents on the farm, except that it had a much happier ending than some. Too often the victim does not like to tell the story.

We visited Miller at the hospital Friday. He told us he had always tried to be careful and had stressed safety to members of his class. "Now I can think of many ways my accident could have been prevented," he said.

Farm accidents have become so numerous and so fatal that national attention is focused upon the necessity of preventing them,

For your own safety and that of your family join in this program of removing all hazards from your farm and stress safety at all times.

You might not be as lueky as Albert Miller.

The Question of Size

"Today we hear a great deal that size, and size alone, is the evil—the detriment of our economy," said Robert D. Dunlop, president of the Sun Oil Company, some time ago. "Such is not the ease. Let us never forget that the framers of our antitrust laws direeted their attention to the abuse of size and power, and that sueh abuse included an intent and an act to restrain and eliminate competition."

The oil industry itself is an excellent illustration of the fact that size has nothing to do with monopply. Some of the companies are very large. And almost all of them began as small concerns, in the not so distant past. They attained their present size because the public liked their products, services and policies.

There are thousands of small oil companies now in business. Some of these will be the large companies of the future. Some of them will fail. But every one of them is free to compete on equal terms with the others. Those which are well-managed and properly financed and administered will survive this competition and go ahead—which is true of all free enterprise under our system of government.

How competition serves the public can be seen on every hand. The quality of oil products gets better and better, and new and valuable innovations are constantly being made. The industry has met a record postwar demand, that no one eould have anticipated, with a minimum of dislocations in the supply line. And oil prices have lagged far behind the general commodity price rise.

Death Rate on Farms

(Continued from page 1)

year. Injuries totaled about 1,800,000.

2. Farm home deaths totaled 7,000, with approximately 1,050,000 non-fatal injuries.

3. Motor vehicles killed 7,300 farm residents in 1947 and injured 250,000 more.

4. The Total of 4,300 farm work deaths was down 4 per cent from 1946, but it still represented 25 per eent of the nation's occupational death toll for 1947.

5. Public non-motor vehicle deaths, sueh as drowning, took the lives of 1,900 farm residents, a sharp increase of 12 per cent over 1946.

6. Fire destroyed farm property valued at $90,000,000 in 1947, one-sixth of the national fire loss.

250,000 Rural

(Continued from page 1)

1914. A summary of last year's activities shows that over 200,000 different rural colored women improved their homes as a result of the program.

Director Wilson says that the program of home demonstration work is helping more rural people to reallize that the end goal of farming is not to raise better livestock and larger crops, but rather to produee these as a means of raising their own level of living up to the truly American standard.

Mrs. Thelma Sanders Is Seed Expert

Mrs. Thelma Sanders, wife of Shepherd Sanders of Clayton, Rt. 2, has done mueh in supplying Johnston County and eastern North Carolina with eertified seeds. She has been a member of the Crop Improvement Association for the past three years, producing certified eotton, tobacco, corn and soybeans. In January of 1946, at the annual meeting of the Crop Improvement Association in Lumberton she made history being crowned Queen of Cotton in North Carolina for displaying the best samples of eotton seed. She received personal congratulations from Honorable R. Gregg Cherry, Governor. She is producing Yellow Special, 402 and Gold Dollar tobac co seed; Coker 100 Wilt resistant cotton, Dixie 17 hybrid corn and Roanoke soybeans.

Dr. Arthur Raper

(Continued from page 1)

afford not to cooperate.

"If you can learn to get along with your neighbors in a co-op, perhaps you can learn to understand a farmer who lives in the adjoining county, or in the next State, or half-way around the world," the social scientist declared.

Turning to some of the over-all problems of farmers, Raper raised seven questions: (1) Are you utilizing science and common sense? Neither will work without the other, he said. (2) Have you realized that your land isn't yours to abuse? The soil does not belong to you; we are all tenants of the Almighty, Raper warned

(3) Are you improving your home? How does your house look to other folks when they drive up? Is your home the kind of place that your daughter likes to bring her beaux? (4) Are you creating the kind of life on the farm for your children that will make them want to stay there and build on to what you have started?

5) Are you and your family eating the right kind of food? (6) Can't you and your neighbors get together and form a co-op to do the things that none of you can do singly? (7) Are you helping to see to it that you have good schools and good ehurches in your community? "The future of your farm depends upon how you answer these questions," Raper asserted.

The three farmers who were on the program to discuss eonservation of the soil had answers that pointed to success. Mr. Winston of Hanover county described how carrying out sound soil and water conservation practices such as building terraces, contouring, strip-cropping, and rotating his crops had increased his corn yield from 10 to 23 bushels per acre. "I am eonvineed," he said, "That soil conservation pays."

Mr. Seott of Prinee Edwards county told his fellow farmers how through recommended soil eonservation practiees he had increased his corn yield from eight bushels per acre to 85. "You cannot have soil that will produce, unless you take eare of your land," he declared.

Mr. Forest of Appomattox county, second place winner in last year's Statewide soil conservation contest, stated that he was able to make a good living on 32 acres beease he followed sound soil conservation practices.

Director Deitriek urged the farmers to continue conserving their soil, "Poor land," he said, "means poor people, poor homes, and poor schools and ehurches." Also, the director stressed the importance of reducing production eosts by growing more of their own food and feed at home. "Each member of your family requires about 1,300 pounds of food a year," he said, "try to grow as much of that amount as you can."

During a two-hour recess the huge crowd of farm people, who had come from every part of the State in private cars and some 30 chartered buses, witnessed exhibits and demonstrations in farm and home improvements. They saw purebreed dairy eattle and poultry, a pasture improvement demonstration, and a display of the latest equipment for farm and home.

Running Water And

(Continued from page 1)

1947 with the youths carrying 1,470 projects. Approximately 50 per cent of the county farm and home agents' time is devoted to 4-H club work.

The two agents have stressed better health and convenient living: more of a diversified system of farming; live at home; community relationship; increased production of corn, small grain, hogs, gardens, and hay; a cow on every farm; adequate living quarters; use of leisure time; acceptance of the results of agricultural experiment stations; use of modern farm machinery; following the advice of specialists, and the four ships—membership, citizenship, partnership and ownership.

The agents work with more than 1,550 farm families and 1,224 operators. Steady increases in cows, gardens, and chickens have been observed by the agents. Mrs. Toole is rounding out her twelfth year as home demonstration agent in the county, while Johnson has been farm agent for the past four years.

The agents report that they look to the future to find every farm self-sustaining with a cow and plenty of food to take eare of the family needs and enough cash crops to justify convenient living.

Negro farmers in Johnston Co. constructed thirty-nine new homes in 1947 and added rooms and other repairs to three hundred and thirty-eight dwellings as a result of a home improvement program started in 1944. Greatest improvement in housing conditions was made by the Reverend J. T. Hocutt of Middlesex, Route 1, a resident of the white Oak community who in 1943 realized that his three-room home was very inadequate for his family of twelve and planned an eight-room dwelling which was recently completed.

At first Hocutt planned to build a home with the help of his ehildren, but through talks with M. L. Wilson, principal of the Richard Harrison school at Salem, he was advised that it would be a waste of time and money to attempt such a program without the experience of carpenter work.

Hocutt postponed his plans and in 1944 attended a joint meeting of the home demonstration and agricultural councils at which time the county and home agents discussed rural living with better meeting, the Negro minister expressed his desire to secure more housing facilities. Following the advice about building and within three days had a choice of three plans to follow in alleviating his family of the very crowded conditions.

Sixteen Counties of

(Continued from page 1)

second. This team presented a demonstration on "Growing Soybeans as a Pasture." The third place team from Vance County composed of William D. Yancey, and Frederick Alexander presented a demonstration on "Seed Bed-Preparation and Seeding Pastures."

The Girls' Demonstration Team contest was divided into two groups. Winners in group one and title of demonstrations were: first place, Delores Lewis and Joyce Yeates, Edgecombe County, "Improving the Satnitation of the Farm Home"; second place, Mervin Porter and Evelyn Peeples, Hertford County, "Cleaning Milk Utensils in the Farm Home"; and third place, Dorthy Richardson and Luc Ellen Brown, Warren County, "Simple Club Refreshments From Dairy Food Praducts."

Winners in group two and title of their demonstration were: first place, Phebia Taylor and Bettie L. Taylor, Pitt County, "Milk Drinks for Health:" second place, Thadys Newsome and Doretha Glasper, Wilson County, Handling the Family Milk Supply; and third place Josephine Yarborough and Ethel M. Grissom, Franklin County "Washing Dishes."

The Demonstration Team from Edgecombe County won the championship in the Girls' contest and will represent the Northeastern District at the 4-H Club Short Course during the week of July 19.

Judging Teams for boys competed in placing sweet potatoes, dairy eows, and poultry. High honors in this event were as follows: Bertie County, first; Halifax County, second; and Beaufort Co. third.

In the girls Dress Revue in the Junior Girls class were first place Patrica Briseoe, of Gates County, second Ermine Williams, Warren County and third place Grace Matherson, Pitt County. In the Senior Girls group Ruth Seott of Halifax County, first plaee, Dorthy Hawkins, Warren County, second plaee and Evelyn Baker, Gates County, third place. Winners in the Senior girls Church Dress class were: Marjorie Gay, Pitt County first place, Okadelia Sharpe, Edgecombe County, seeond place and Mary Lee Farmer, third place, Wilson County.

The Contests this year were well attended with approximately 500 4-H Club members, leaders, agents and specialist present.

Farm Talk with Farm Folk

By Jesse Safley

We heard a man recently, he was not a farmer, express a fear that price controls would be placed on meats, butter and other foods again. "Even though I have to pay more for bacon, lard, and beef today I am able to get it, which was not the case when those items were under price eontrol," he said.

This is about the general concensus of most everyone we have heard express an opinion on the president's anti-inflation program.

They would all enjoy paying less for food purehased, but the broad minded have wisdom enough to know that as food prices decline the farmers' income will decline. They realize that farmers of all classes suffered more from the standpoint of prices during the war and that it has only been since the removal of price controls they have been allowed a fair profit for their products.

The farmer is no longer the leading figure in the eyes of some political leaders now that all grain elevators are filled to running over and millions of bushels of wheat, oats and other grains are being stored in open bins. The meat shortage which many predicted and were personally concerned about has not come to pass. Everything in the food line has a rosy appearance; therefore, some of those with power are asking for more in order that might gain politically in the months ahead.

A principal move at present is to roll back the prices of certain foods to the level some six or eight months ago and hold them there for a period by the "eeiling price" method. This would no doubt reduce the farmers' income.

No plans are proposed for the rolling baek of priees for those items including labor that the farmer must have to produee food. At least if there are any such proposals they are being kept in the dark.

Farmers for years and years followed the pattern of increasing production as prices declined. The lower eommodities sold, the harder they attempted to produce more. They produced at the expense of their bank account, their soil and energy. Will this happen again or have farmers learned they can no longer afford to produce when priees received are below the cost of production?

Whether the present session of Congress will enaet price cuts and ceilings is anyone's guess.

This Is Where the Hocutts Lived Before They Built Their Eight-room Modern Home

A Knight of the Pine Woods

One fall Bobby went with Mother to visit Aunt Lou and Cousin May in their plantation. The weather was warm and bright, and Bobby had a wonderful time.

Bobby thought it was lots of fun to ride in the oxcart when old Sambo hauled oak leaves away from the yard.

Sometimes he went with Cousin May on long tramps through the woods, too. They carried a lunch and ate it out there, sitting on the nice brown pine needles in the shade of the tall pitch pines. After they ate lunch, they always cleared a place on the ground and scattered some crumbs for the birds.

One day Cousin May and Bobby started off for a picnic. She carried the basket, but she let Bobby have a peep inside.

My! How nice the sandwiches looked, with slices of pink ham in each!

When they had finished lunch, Cousin May suddenly said, "Bobby, I don't feel well at all. Can you go back home and ask Aunt Lou to send me the pink medicine bottle on my table, She will know which one."

Bobby looked worried. "Do you think I can go all by myself?" he asked.

"Oh, yes, you are my brave boy," said Cousin May, "and anyhow, there is nothing to hurt you. If you see a squirrel, just tell it good morning, and run on. Please go, Bobby, I'm really too sick to walk"

Cousin May turned so pale that Bobby was frightened. "I'll run all the way!" he said.

Bobby felt very queer going home all alone. He ran so fast that he tripped and fell and skinned a place on his leg. How it did hurt! But he did not cry. He jumped up and ran on, and into the house, and found Aunt Lou. Even then he didn't say a word about his leg, but asked her for Cousin May's pink medicine.

Aunt Lou hurried and got the pink medicine, and another bottle, too.

"Now come quickly and show me where you left Cousin May," she said.

Bobby led the way down the road as fast as Aunt Lou could walk. She saw that Bobby's leg was hurt.

"You're a brave boy, Bobby, to walk all this way to help Cousin May and your leg is hurt," she said. "As soon as I give her this dose of medicine I'm going to put something on your leg to make it well."

Soon Bobby and Aunt Lou were back in the pine woods. Aunt Lou gave Cousin May the medicine, then she put something on Bobby's leg that made it feel much better.

Soon Cousin May said she left almost well, so they walked slowly home.

Afterward Bobby and Cousin May always called that "The Sick Picnic," and Cousin May always called Bobby, "My Pine Woods Knight."

The Merry Little Monkey

By Margaret O. Slicer

Once there was a merry little monkey. All his brothers and sisters were merry, too, but he was the merriest of all. He could climb the tallest palm trees, throw the biggest coconuts, and make the funniest little faces.

But he had one terrible habit. He was very untidy. His hair was untidy, his bed in the treetop was untidy, and the way he ate—that was the worst of all. Especially when he ate bananas. His mother chattered and scolded, but you could always tell just where the merry little monkey had been in the jungle by the trail of yellow and brown banana peels scattered about. Of course, he scattered orange skins and coconut shells too, but the other monkeys didn't slip and slide on them as they did on the banana peels.

One day, after a long dry season when bananas were very hard to find, the merry little monkey learned that on the top of a hill not far away was a great big banana tree just full of ripe yellow bananas.

"Just the thing for me," said the merry little monkey, so he tied up some figs and dates in a palm leaf to eat on the way and set off in search of the banana tree.

After he had swung along through the trees for a long while, he saw the hill. There were no other trees on it, but right at the tiptop was a beautiful banana tree. The merry little monkey jumped for joy when he saw it. His mouth watered at the sight.

In no time at all, he was up at the top of the tree eating bananas one right after the other. And they were every bit as good as they looked.

As he ate he threw the slippery banana peels around in all directions until the whole top of the hill was covered with them.

Then after a while he began to long for a drink of water. Down at the bottom of the hill was a little stream. The merry little monkey went swinging to the bottom of the banana tree and ran down the hill, slipping and sliding on the banana peels because there were no more trees.

At the bottom of the hill he pulled up short. Right in front of him was a huge animal with a bushy mane. The little monkey shook with fear. It was a lion

The lion looked up and saw the merry little monkey. He gave a terrible roar.

"What are you eating for lunch, Monkey?" he growled.

"B-b-b bananas," said the little monkey.

"Do you know what I am going to eat for lunch?" asked the lion showing his big white teeth.

"No," said the merry little monkey, feeling anything but merry now.

"YOU " roared the lion, as he started up the hill after the monkey.

Now the merry little monkey was so frightened he couldn't look where he was going and he kept slipping and sliding on the banana peels he had thrown around. He just couldn't seem to get anywhere. The lion, who was not frightened at all, but only hungry, watched where he was going and didn't slip at all. He kept getting closer, closer, and CLOSER.

Just when it seemed the lion's sharp teeth would seize the monkey, the monkey jumped into the banana tree out of the lion's reach.

He sat and rested for a long time. What a scare he had had!

After a while the lion got tired of waiting for him to come down, and with another roar, went off into the jungle. Then the merry little monkey came down out of the tree, carrying a bunch of bananas he was taking home for his mother. He ate a few as he went along, but he was very careful not to drop any peelings on the ground. One narrow escape was enough for him.

Pullman Porter To Receive Award

An alert Pullman porter who spotted a mechanical defect on a train bound from New York to Chicago will receive the regular monthly award for October of the Federation for Railway Progress, it was announced today.

The porter, Joseph Williams, of 133 Elgecomb Avenue, New York, N. Y., regularly assigned to the New York-Chicago run on Pennsylvania Railroad trains Nos. 49 and 2, will receive a $25 United States Savings Bond. The bond is given each month by the Federation to a railroad employe chosen for outstanding acts of courtesy or service reported by travelers to the Federation.

On July 28, while on train No. 49, approaching Trenton, en route to Chicago, Porter Williams discovered a hot box, already in flames, on his Pullman car. A hot box is dangerous because it may bring about derailment by weakening an axle and causing the axle to break. Porter Williams reported his discovery to the conductor and the car was quickly set out and shopped for repairs at Trenton.

The Federation member who reported Porter Williams' action was W. E. Hetzel, of 200 Madison Avenue, New York, N. Y., who commented: "This could have been a serious wreck except for the vigilance of Porter Williams." Mr. Williams, 43, has been employed by the Pullman Company for over twenty years. He has good service record with the company, including numerous commendations from passengers.

Invention Of New Bottle For Feeding Babies Announced

Collapsible And Disposable, To Revolutionize Infant Feeding

Washington, D. C., Oct. 22—A new kind of baby bottle—collapsible and disposable—which, according to its producers, will revolutionize infant feeding was announced today.

The new bottles, called Shellies, are a radical departure from the rigid glass bottles which have been standard equipment with mothers and in hospitals for more than eighty years.

Described by their inventor, a Washington, D. C., registered nurse, as "the nearest approach to breast feeding," Shellies have a number of immediately apparent advantages for both mother and baby. For mother, there are no bottles to brush, scrub, and sterilize, because Shellies are pre-sterilized, are used once and then thrown away.

For baby, the fact that the new bottles are collapsible means an end to fighting back-pressure or partial vacuum, an end to collapsed nipples, and an end to air-swallowing. With Shellies, baby need only be "burped" once, at the end of the feeding. No more hard, heavy, breakable bottles to cause possible injury, either, because Shellies are made of soft, pliable, yet strong "Shellene," a new plastic material.

The new bottles have a psychological advantage, too. Soft and warm when filled with heated formula, they give the baby a feeling of security and comfort which, pediatricians and psychiatrists say, is important in early infancy.

Shellies come in a long roll—each bottle sealed off from the next in line. The bottle—in either four or eight-ounce size—are snipped from the roll with scissors, filled with formula, fitted with sterile nipples, and placed in the refrigerator. Before nursing, the air is squeezed out of the pliable bottles so that baby gets his formula completely free of air.

Easy to assemble, Shellies are equipped with plastic caps which insure the sterility of the nipple and at the same time render the whole bottle leak-proof. They can be dropped on a hard surface without breaking and can be carried loose in a handbag or suitcase without danger of leakage or contamination.

Another advantage of the new bottles is that they are much easier to heat than glass bottles. Filled with formula or milk, they can be brought to body temperature in one minute by simply holding them under a hot water tap.

Shellies were invented by a registered nurse, Adda May Allen, of The Plains, Va. Mrs. Allen, long experienced in infant nurseries, conceived the idea years ago after daily facing the task of washing and sterilizing dozens of baby bottles in the hospital where she worked. Through her efforts and through the work of the Shellmar Products Corp., a Mount Vernon, Ohio manufacturer, the product is now ready to be sold to mothers and hospitals throughout the country.

Already used by nearly five hundred test mothers, the new bottles have had an enthusiastic reception. Leading pediatricians who have seen it—some of them have used it with their patients, highly approve of the idea of closely approximating breast feeding.

The disposable bottles, which come in rolls of sixty-five and one hundred will cost about one cent each. Bottles for a normal day—six feedings—will cost slightly more than a nickel.

Singer Ella Surprises Scots in Special Scotland Session

Glasgow, Scotland—America repayed Scotland back for sending us their great entertainer Harry Lauder when American song bird Ella Fitzgerald made a surprise appearance at the Empire Theatre in the Scots' capitol city. Opening on Friday, September 24, Ella packed the theatre nightly during the week she appeared in Glasgow.

Originally the First Lady of Song was supposed to bow into the Palladium in London on September 27 for a full month's stay But the previous show had been held over an extra week and so the singer had some spare time on her hands. It was at this moment that fate, in the form of a deluge of fan mail from Scotland, took a part in forming the plans for Ella's immediate future. Most of the fan mail came in the forms of pleas for Ella to appear in Scotland, even if only for one night. In a quick exchange of telephone calls and telegrams, a deal was made between Scotland's leading theatre, the Empire, and La Fitzgerald.

When the Glasgow newspapers announced the fact that the American song stylist would appear the next evening, the Empire's box office was flooded with telephone calls asking for reservations. On opening night, two hours before the show was scheduled to go on, a line began to form. By curtain time, the line extended a block beyond the theater's entrance. Glasgow police were called upon to keep the impatient fans in line while waiting for almost-impossible to get tickets.

The Palladium date, in the meantime, was moved ahead a week and so Ella's London fans will sit and be able to see the songstress for a month at the British capitol's leading vaudeville house.

Pressley To Captain Globetrotters

Chicago, Ill.—(Special) — Louis (Babe) Pressley, the "Cleveland Comet," again will captain the Harlem Globetrotters basketball team, according to an announcement issued here this week by A. M. Saperstein, owner and coach of the great quintet.

To the Globetrotters the personable Pressley is "Mr. Basketball" himself. Saperstein has gone on record time after time proclaiming Pressley the best guard in basketball. He likewise rates him as the greatest guard the Globetrotters have ever had.

The idol of his teammates, Babe is the perfect leader for the team, and the inspiration that has pulled them through countless important victories, such as the great one over George Mikan and the Minneapolis Lakers at Chicago Stadium last season.

This is Pressley's twelfth season coming up with the Trotters. Saperstein is not alone in rating him the best defensive player in basketball. He twice was named All-American in Associated Press polls. The six-foot, one-inch, 205-pound husky is a good shot and has won many games for the team with his deadly accurcay. Fast, aggressive and basketball-wise, a player's player and revered by his teammates and fans alike, Pressley should have his greatest season this campaign.

Coming with him from Cleveland for the start of practice later this month is that city's other fine contribution to the dazzling Negro unit, Donald ("Ducky") Moore. One of the best long shots in basketball, Moore will be starting his fifth season with the club, having joined the Globetrotters after a brilliant prep career with Central High School of Cleveland. He stands around six feet in height and tips the scale around 168. Ducky is listed as a forward on the Trotters' 1948-49 roster

Catholics Win Case In Hard Fought Legal Battle

San Francisco, Calif., Oct. 21—(Spl.)—In California it is no longer illegal for white people to marry Negroes or persons of other minority groups.

A 98-year old California law prohibiting the marriage of whites with Negroes and another banning the marriage of whites with Mongolians, Malayans or mulattoes were voided here last week by the State Supreme Court as contrary to the First Amendment of the U. S. Constitution.

As a result of the decision, the Los Angeles county clerk was directed to issue a license to wed to Andrea D. Perez, a white woman, and Sylvester S. Davis, Jr., a Negro. Both are Catholics. Their case was argued through California courts for them without charges by Daniel Marshall a Los Angeles lawyer and leader in the Los Angeles Catholic Interracial Council.

The couple declared in their petition that the Catholic Church did not forbid their marriage and that the California law, through its prohibition of their marriage, infringed upon the free exercise of their religion.

The court, in its majority opinion, also brought about four broad reasons for voiding the statutes:

(1) Any legislation restricting a basis institution like marriage "must be based upon more than prejudice and must be free from oppressive discrimination."

(2) The right to marry is an individual right and cannot be limited on the basis of race alone.

(3) While the State has to regulate marriage to prevent disease or the decay of the race, this factor is not involved, since experts are agreed that interracial marriages do not in themselves produce inferior offspring.

(4) The law cannot be justified as a means of easing racial tensions but actually tends to perpetuate the "prejudices that give rise to the tension." If this line of reasoning were carried out, the court remarked, mixed religious marriages could also be prohibited.

The dissenting judges pointed out that 29 other States have laws prohibiting interracial marriages and none have been challenged successfully. They held that "crossing of the primary races leads generally to retrogression." The court was divided four-to-three on the decision.

Tom Dewey Is Dirt Farmer Magazine Says

New York—Governor Thomas E. Dewey has brought the same kind of down-to- earth efficiency to his Pawling, N. Y. farm that he has brought to the New York State Government.

That's the substance of the lead article in the forthcoming October issue of Country Gentleman, "His Feet Are on the Land," written by H. E. Babcock, dairy farmer, author and close friend of the Republican nominee.

As a farmer, Babcock writes, Governor Dewey likes to pioneer, but not until he dicides that a new idea meets his inquisitive test. "Does it pay?"

The Governor's pioneering in farm management has, however, made him an authority and leading exponent of such dairy farming innovations as pen staling and grass silage.

Country Gentleman reports that "Dewey's interest in farming is real and deep and sincere. He has an aiding respect for the sanity and food judgment of farm people.

Wells Leave FCA

Farrington Acting Commissioner

Washington, D. C.—J. B. Wells, Jr., has resigned as Cooperative Bank Commissioner of the Farm Credit Administration to accept the position of general manager of the Farmers Union Live Stock Association according to I. W. Duggan. Governor of Farm Credit Administration. Robert L. Farrington, Deputy Governor of the Farm Credit Administration and one of its career employees, has been designated by Governor Duggan to serve as Acting Cooperative Bank Commissioner while retaining his title as Deputy Governor. Mr. Farrington, who came to the Federal Farm Board in 1931, has been in the employ of the Farm Credit Administration or the Department of Agriculture ever since Farm Credit Administration was created in 1933.

Mr. Wells will start on his new duties August 1 which will include direction of the extensive cooperative operations in Minnesota, Iowa, North Dakota, Montana, and Illinois, through livestock marketing headquarters in South St. Paul Chicago, Fargo, and Billings.

The co-op's line operations and subsidiaries include the Central By-Products Company which operates 17 plants including two feed mills in four States. Mr. Wells' experience in Federal Government service harks back to the Federal Farm Board and the cooperative division of the Department of Agriculture where he worked between 1927 and 1933. He has held numerous positions in the Government, including deputy cooperative bank commissioner, director and secretary-treasurer- of the Commodity Credit Corporation, acting president of the Regional Agricultural Credit Corporation, special assistant to the Secretary of Agriculture and to the Administrator of the Agricultural Marketing Administration. He served as Deputy Governor from 1942 to 1947 and in the latter year was appointed Cooperative Bank Commissioner. Mr. Wells was born in South Dakota, where he worked as a cashier in a country bank, served as a county agent, and became familiar with the agricultural problems of the State.

Wrong Scapegoat

A poll was recntly taken to find out what typical American families think is responsible for high living costs. Nearly a third of those answering were of the opinion that manufactufers are making too much profit, and retailers' mark-ups are too large.

This is a perfect example of picking a scapegoat, regardless of the merits of the case. The truth is that if industry—and particularly that part of it which makes consumer goods—were to operate at no profit the influence on prices would be far less than most of us realize. In other words, profit—which is simply that part of industry's gross income which is kept by the people who own it—is only a drop in the bucket by comparison with wages, cost of supplies, taxes, etc.

On the retail level, the same thing is true. A number of large food chains have reported that they make, as profit, less than two cannot give us back keep-akes and them. Representative variety store systems report that they they only make about five cents. And when it comes to mark-ups, too many consumers don't know that stores of all kinds have voluntarily reduced them as part of retailing's fight against inflation—and in many cases they are now less than in OPA days.

Millions of words have been written on the causes of inflation. What the people should understand is that in a competitive, free enterprise economy prices are as low as the cost of doing business permits. And the merciless force of competition takes care of those who work on the all-the-traffic-will-bear principle.

Prune Tomatoes

Prune tomatoes to two main stems and tie these up to a stake. Keep all lateral branches pinched out of these main stems. Bigger and earlier fruit comes from pruned plants.

CLEAN RANGE

Move young growing pullets to clean range. Experiment station figures show that first year pullet death rate can be cut 50 per cent when raised on clean range.

THE COLORED

YMCA

Can Accomodate

TRANSIENT MALE PATRONS

When coming to Nashville you are requested to stop at the Colored Y.M.C.A., Fourth Avenue North and Charlotte Avenue.

The rooms are located on 3 floors. Splendid outside rooms with much of the modern conveniences.

It is located in near down town Nashville.
There are clerks on duty twenty-four hours every day.

The rents are reasonable.

If any man wishes to take permanent residence in the building, this can be arranged.

Come to the Colored Y.M.C.A. while in the city.

COLORED YMCA INCORPORATED

Fourth and Charlotte Avenues

Nashville 3, Tennessee

Dithane Z-78

A FUNGICIDE THAT PROTECTS MANY CROPS AGAINST DISEASES

Effective disease control is essential to successful crop production. In the past it has frequently required the use of several fungicides to accomplish this. And while some materials would control diseases they also injured foliage and blossoms thereby reducing yield and lowering quality.

Dithane Z-78 is an organic fungicide containing 65 per cent zinc ethylene bisdithiocarbamate. It has been thoroughly tested and commercially proved on the crops for which it is recommended. The fact that Dithane Z-78 is effective against a wide range of diseases of vegetables, field crops, and ornamentals explains why many vegetable growers regard Dithane as the closest approach to a universal fungicide that has been developed.

A safe fungicide—Dithane does not injure blossoms or retard growth. Large foliage and vine growth is ultimately reflected in the quantity and quality of crops harvested. Numerous reports on controlled experiments cite increases in yield and better quality from vgetables sprayed or dusted with Dithane.

Dithane Z-78, is a light yellow powder which mixes readily with water to form a highly suspendable spray that does not clog or corrode spray equipment. Applied to foliage Dithane sticks, leaving a almost invisible residue. Although additional spreading and sticking agents are not ordinarily required, the use of a small amount of Triton B-1956 is recommended where the spray is to be used on hard-to-wet plants such as celery, tomato fruit, etc.

Dithane sprays and dusts are compatible with commonly used insecticides. Dusts based on Dithane Z-78 are prepared by leading dust blenders in all sections of the country.

Highly effective in the control of many of the diseases of vege tables Dithane Dusts are of particular interest to growers of potatoes, tomatoes, cucurbits, and celery.

For potatoes—Dithane Dust with DDT is the outstanding combination for blights and insect pests. Yield increases of 40-60 bushels per acre from Dithane protected crops are common.

Tomato growers favor Dithane Dusts because they control anthracnose as well as early and late blight. The safety of Dithane Dusts is a major advantage to growers of cantaloupes and cucumbers.

Dithane Dusts are carefully formulated to meet plant disease problems existing in local areas. Dual purpose mixtures of Dithane Z-78 and commonly used insecticides are recommended where insects as well as diseases are to be controlled.

Use More Fertilizer to Grow Good Garden

Failure to use enough fertilizer is the greatest fault of most Alabama gardners.

Manure, mixed fertilizers, lime and borax are listed by J. C. Ford, API extension gardner, as "musts" for highest vegetable yields. He recommends the use of manure every year at the rate of 20 tons per acre. Broken down to garden size this amounts to 100 pounds for each 50 feet of row.

For mixed fertilizers he says a good rule is to use 10 pounds (1 1-2 gallons) of 4-10-7 or 6-8-4 to 100 feet of row. For sweet-potatoes use 5 pounds to 100 feet. Except on the lime soils of the Black Belt, apply 1 ton of lime or 2 tons of basic slag per acre every 4 or 5 years.

For best root crops—beets, carrots, turnips rutabagas—on sandy land apply two tablespoons of borax to 100 feet of row.

Careless Handling of 2-4-D Can Cause Much Damage

By Dr. FLOYD BRALLIAR
Garden Editor
The Nashville Tennessean

Now that 2-4-D has been widely advertised and the public is beginning to use it, it seems important to write a few words of caution lest more damage be done than good by its careless use.

It is all so new and there are so many people who have never learn ed to follow directions that there are certain to be some unfortunate experiences unless we are very sure to follow directions given on the container when we use any weed killer.

The 2-4-D dust should never be applied around the home or small garden with an ordinary dust gun if there is the least bit of breeze. Properly applied this chemical will do no damage to desirable plants, but if the fine dust is blown by the lighter breeze it is likely to come in contact with some valued plant and cause its death. It will kill our flowers, shubbery, evergreens, trees, and most of our garwden vegctables if it is blown on them.

Large Hand Shaker

The best kind of applicator for home use is a large hand shaker shaped like a pepper box. With this is is easy to hold the shaker near the ground and unless there is a wind blowing the dust will not be carried to valuable plants.

Of course the ordinary dust gun may be safely used if the day is still and the duster is held low and much force is not used. But it is better to hand dig a few weeds near desirable plants than to take chances.

In liquid form 2-4-D is safer to use about the home for the spray does not carry so far in the air as does dust, but even in liquid form it is better to wait for a calm day to spray. Even then it is a wise precaution to cover especially valuable plants with a canvas or some other protection while the spraying is to be done. One other warning should be given.

Do not use a sprayer or dust gun to spread 2-4-D and then for spreading some insecticide before cleaning the sprayer most thoroughly: for even if only a little of this chemical is blown on the leaves of a plant it may kill it.

Fatal to Chickweed

But there are so many valuable things this chemical will do that we cannot afford not to use it. To illustrate, we saw a strawberry patch a few days before blooming time that was almost hidden by chickweed. The owner feeared to hoe out the chickweed lest he injure his berries. Knowing that strawberries were not easily injured by this chemical while chickweed was easy to kill, our advise was followed and in a week the strawberries were free from weeds and were uninjured.

Last summer we saw hundreds of small trees and bushes growing along the sides of a country road killed root and branch by beeing sprayed with 2-4-D. Even wild honeysuckles were completely killed by one application, but the thing that pleased us most was that the remains of an old Osage Orange Hedge, we usually call it mock orange, or hedge apple, were completely killed. Not a sprout came up even from the long roots, yet the grass growing among this roadside brush was not injured.

Dreaded Elm Disease

This does not mean that we can spray a pasture for weeks and turn stock on it at once. Keep all stock off of such pastures for three or four weeks or until there has been three or four good rains.

Another thing we wish to discuss today is the protection of our elm tree against the dreaded elm disease. While it is true that this disease is largely confined to the East, there have been a few cases in Tennessee and other parts of the South where elm trees were undoubtedly infected by this disease, for we have seen some of these trees and sent specimens to the government to experts who pronounced it to be Dutch elm disease.

This disease is spread from tree to tree by certain insects. The Arnoldia Arboretum says, "There is no practical method of spraying to control the disease fungus once it is in living trees. All spraying attempts are directed towards controlling the insects on the trees." But it adivses to destroy all dead elm wood immediately.

Sanitation Necessary

The disease is carried by bark loving insects that live largely in the bark of dead wood, therefore if all dead wood is destroyed promptly we shall go a long way toward preventing the spread of the disease. The Arnoldia Aboretum experts tell us that sanitation is the best present conrol mehod, for this disease. We quote from a recent bulletin:

"Sanitation would include several things. First, it would include the removal and destroying of all dead elm wood. This is best done by burning immediately. Elm wood can also be stored indoors so that when bark beetles emerge they can not fly out-of-doors. Spraying dead elm wood with oil (one lb. DDT in 12 1-2 gallons of No. 2 fuel oil) on all sides has also proved an effective means of preventing the emergence of bark beetles and of killing them if they alight on such treated wood. Immediately burning, however is bestd

"Elm wood, dumped in piles or thrown about on town dumps can serve as a source of disease infection for the entire community, unless it is burned or thoroughly sprayed immediately. Elm logs over a year old do not serve as likely sources for hibernating beetles, but freshly cut elm logs do.

"Completely removing the bark of all logs as soon as they are cut or keeping them completely submerged under water has also been recommended, but these methods are rather difficult to carry out properly.

"Sanitation would also include the prompt removal and burning of dead elm branches on normally healthy trees.

"Fertilizing the trees to keep them in a healthy, growing condition could easily be construed as being part of the general sanitation program."

If we comply with this program we should not only be safe from Dutch elm disease but our trees will be more beautiful as well.

POOR HEALTH HIGH IN RURAL COUNTIES

Sickness strikes most frequently in poorer homes. This was revealed in a national survey by national extension workers. In fam ilies with incomes of $3,000 a year or over, less than four days per person are lost annually from illness, but in families with incomes under $1200, nearly nine days are lost from illness.

Even in a good year, such as 1941, half of all farm operators had annual net cash incomes of less than $760 per family.

Low incomes cause ill health in an area and also cause doctors dentists, nurses and all health serv ices to be scarce. New physicians and other health workers have for years been settling in cities and older professional workers have been migrating from rural areas to cities.

Egg Care

Eggs are now among the plentiful foods. They need to be kept in a cold place if they are to be kept fresh. Experiments have shown that at room temperature eggs lose as much freshness in three days as they do in the refrigerator in two weeks. Keep eggs covered for two reasons: (a) to keep them from losing moisture,(b) To protect them from absorbing other flavors.

Do not wash eggs until just before they are used. The dull "bloom" on the shell helps prevent bacteria and odors from entering the pores of the shell.

You Can't Eat Grass

Close to half the land of this nation would be useless for food production if it weren't for the breeders and raisers of livestock and the packers who start meat along the cannels that end at the dinner table.

You can't eat grass. By itself, it adds nothing whatever to the food supply. Meat animals, on the other hand, thrive and grow on it. Inedible grass becomes edible meat that keeps the country's larders full.

Our meat animal population must be kept at a high level if we are to supply our own needs and maintain our foreign exports. We can't turn our meat supply on and off like a faucet. There's no miraculous assembly line that will produce an animal ready for the packers in a few minutes. It takes more than a year to grow a marketable hog, and two or three years to grow a beef steer. Any considerable decline in our animal population would take a long time to make up. The only sound policy for American agriculture, in the words of the Secretary of Agriculture, is "organized, sustained and realistic abundance."

Meat animals, which are the farmer's chief source of cash income, are also the backbone of a tremendous competitive industry which processes the product for a profit of only a fraction of a cent per pound. Meat is a staple item in the American diet, and the whole process of producing it begins on grass-land, a great portion of which is useless for anything save the feeding of livestock.

U. T. ADVISES FARMERS ON FALL SEEDING

Farmers planning late summer and fall seedings of alfalfa, small grain and winter legumes, should follow practices advanced by the U. T. Agricultural Experiment Station.

"This is true from the standpoint of type and varieties of seed used as well as date and method of seeding," Davidson County Farm Agent Oscar L. Farris said

"Many farmers reduce their income from fall seedings by using low quality seed," he said.

Recommended cover crops and varieties, based upon findings of the U. T. Agricultural Experiment Station include:

Kansas and Oklahoma common alfalfa, Tennessee resistant, Cumberland, and Kenland red clover; common and Dixie crimson clover; hairy vetch; Early Southern and Giant bur clover; Austrian winter peas.

Fulcaster 612, Thorne and Carala wheat; Forkedeer, Stanton, and Fulgrain oats; Jackson No. 1, Missouri early, and Beardless barley; Balbo rye, Italian ryegrass.

Recommended seeding rates and dates, with general remarks on crop characteristics, are given in the new Extension Leaflet 101. Get copies from the county agent. Ask for the new cover crop leaflet, "Keep Tennessee Green in Winter."

Tuscaloosa, La. 4-H Clubbers Active

Five thousand Pine and Cork Oak trees were planted by 4-H'ers in Tuscaloosa County. These seedlings were planted on land around the 9 Junior High Schools in the county. The plants were furnished by the Forestry Department. These facts were reported by Constanee Jackson at a recent meeting of the County Counell.

Her reeport on what the different clubs were doing showed that they did more than planting these seedlings. They observed Carver Day, the National 4-H Club Week as well as Rural Life Sunday. A eampaign to elean up breeding places of flies and mosquitoes is now being planned by the Counell.

When your bed sheets have worn out, they can be folded in half and used for making pillow slips.

MEAT

Meat is too valuable, both for its protein and its flavor, to waste any of it. Part of the cook's skill is to make good use of every bit.

Book meat bones with beans or soup to extract all possible flavor, and nutrients too.

Use rendered fats in gravies and sauces and ground cracklings in quick breads.

The following information on the yield from various cuts of meat will help you decide how much to buy to get enough lean meat for a main dish serving. It will also help you figure the cost per serving.

Much bone or gristle—pound yields 1 to 2 servings. Examples are shank, brisket, plate, short ribs, spareribs, breast of lamb or veal.

Medium amount of bone — a pound yields 2 to 3 servings. Examples are whole or end cuts of beef round, veal leg or shoulder, ham with bone in; also steaks, chops or roasts from the loin, rump or rib sections.

Little bone—a pound yields 3 to 5 servings. Examples are center cuts of beef round, or ham; also lamb or veal cutlets; chuck.

No bone—a pound yields 4 to 5 servings. Examples are ground meat; boneless stew meats! liver or other variety of boneless meats.

BUYING MEATS

Homemakers who are after good buys at the meat counter will consider the grade and the cut.

By choosing U. S. Good, Commercial, you usually pay less per pound for similiar cuts. Also you may get more lean meat to the pound since these less expnsive meats often have less marbling of fat. It will be worth your while to compare prices in your community.

The cut refers to the part of the animal from which the meat comes. The buyer can save money by using the less tender cuts of beef, the less popular cuts of pork, lamb and veal, and organ or variety meats such as liver, heart, and kidney when they are available. The protein in these cuts is just as good nutritionally as in the expensive cuts. In some variety meats it is even better. Of course in comparing prices of cuts you'll need to allow for bone and gristle, which raise the cost of the edible portions.

It pays to know the best way of cooking the different cuts. Do you know what cut to choose for a pot roast or stew? There is no hard and fast rule but here is a handy guide for some of the less expensive cuts:

For braising as pot roasts and Swiss steaks: Beef round, beef rump, beef flank, beef chuch, beef short ribs, heart. veal (all cuts.

For broiling, frying or roasting: Lamb (all cuts), Pork shoulder, ground meat, Liver, Brains, Spareribs and pork chops.

For simmering as stews and soups: Neck, plate, shank, brisket and kidneys.

To Make Meat Tender

Good cooking can help make any cut of meat a favorite main dish with the family. Here are some of the methods that skillful cooks use for less tender cuts:

Long slow cooking, as for braised meats and stews.—For extra flavor first brown meat in a little fat. To braise, use little or no liquid except the juices that cook from the meat. Cook elosely covered, with low heat. To stew, add water to partially cover meat, cover kettle, and simmer.

Grinding, pounding, scoring.—The meat grinder helps make meat tender. After grinding, any meat cooks as quickly as a tender cut. Pounding or scoring with a knife before cooking is similar in effect to grinding but tenderizes meat. less.

SEASONINGS

Meat itself is usually flavoring enough for the main dish. Meat is often browned in a little fat to develop its flavor. In combination dishes, highly flavored or cured meats such as ham, dried beef, corned beef, and sausage may carry their taste further than fresh mat.

When the meat is limited, other foods add zest and additional food values. Tomatoes, onions, parsley, chives, green peppers, celery, sour cream, lemon, nippy or smoked cheese—all contribute in both ways.

Other seasonings your family may enjoy with meat are bay leaf, catsup, chili, curry, garlic, marjoram. paprika, sage, soy sauce, sweet basil, tabasco sauce, thyme, Worchcstershire sauce. Since these are used in small quantities and keep many months, they are not expensive in the long run.

Use of Lime Skyrockets in Weakley

Weakley County farmers have increased use of agriculture limestone during the past 10 years by more than 600 per cent, according to a recent report released by I. G. Hatler, chairman of the Weakley County Agricultural Conservation Association.

Last year, they applied 17-731 tons of lime as compared to 2,500 tons in 1938.

They also increased the use of phosphate by 465 per cent and potash by 435 per cent, applying 4,324,000 pounds of Phosphate last year as compared to 800,000 in 1938 and 16,000 pounds of potash against 3,000 in 1938.

Large increases were also noted last year in winter cover crops alfalfa, permanent pastures and seceria. Almost 10,000 acres were sown to winter cover crops, 265 to alfalfa and hundreds of acres to permanent pastures of perennial legumes and grasses.

Approximately 60 per cent of the crop land in the county was included in the conservation program. the report revealed.

Although much progress has been made in the past few years, maximum soil conservation practices on all farms would necessitate doubling present practices on most items. Hatler said. He estimated the annual need for lime at 35,000 tons. phosphate at more than 8,000,000 pounds and winter cover crops at 15,000 acres.

Flies Are Thick

Flies are everywhere at this time of the year. Houseflies are thick around the barns, milkhouse and home. It costs money to have these pests around. Houseflies spread disease that results in at least a doctor bill.

Destroy these pests with DDT. Spray barns, poultry houses and other buildings with a mixture of one pound of 50 per cent wettable DDT in 10 quarts of water. If a good job is done in spraying outbuildings, it is not necessary to spray the home.

NEW HOSIERY COLORS ANNOUNCED FOR FALL

In response to the demand for seamless nylon hose in dark colors to complement dark shoes and suits, manufacturers have announced several shades that will be available this fall.

Among the popular colors will be a sultry black, a navy with of purple; a gray-brown taupe, to wear with tweeds and wools; a bronzy brown, to wear with copper, as well as convention brown kid: a bottle green for the really daring lady to dramatize her olive green suede and velvet opera pumps.

The condition in which an animal will go through the winter depends a great deal on the treatment that animal reeeives during the summer and fall. Now is the time to spray for flies and other insects which reduce the amount of resistanee an animal might develop to diseases during the winter.

Parasites

Continue to watch flocks of lice and round worms and if either are present, take steps to control them. See your County Agent.

First President

The late R. H. BOYD, founder of the National Baptist Publishing Board and builder of the National Baptist Publishing Board Plant, recognized as the premier member of the fourth estate in publishing and distributing Baptist literature. He was the first President of the Citizens Savings Bank and Trust Company.

First Cashier

The late J. C NAPIER, the first Cashier of the Citizens Savings Bank and Trust Company. He was an Attorney-at-law, by profession and was former Registrar of United States Treasury and had been twice chosen as presidential elector and served for many years as a member of the State Executive Committee of the Republican party in Tennessee, and was a former President of the National Negro Business League.

First Chairman

The late PRESTON TAYLOR, first Chairman of the Executive Committee. He was the owner and senior member of Taylor and Company Undertakers, he purchased Greenwood Cemetery, the largest of its kind in the United States, and he also built Greenwood Park, a large recreational center. He was organizer and builder of the Lea Avenue Christian Church and was President of the National Convention of Christian Church workers.

We Will Honor The Intrepid Three

A Trio of Nashville Men Who Accomplished Things in Life—Whose Memory We All Cherish

The Citizens Savings Bank and Trust Company, located at Fourth Avenue, North and Charlotte Avenue (formerly Cedar Street), invites the people of this city, this state and nation to join in with them in honoring the late Richard Henry Boyd, the first President of the Citizens Savings Bank and Trust Company, the late Preston Taylor, the first Chair man of the Executive Committee and Board of Directors, and the late J. C. Napier, the first Cashier. This is the oldest bank of its kind in the United States and for the next three months the depositors, stockholders, directors, Executive Committee and officers will be conducting a "Deposit Shower Campaign" to honor these three stalwarts as we approach our forty-fifth birthday. Everybody can join in this movement, little or big, young or old, male and female of every walk of life, regardless of race, creed or color, in opening a savings account in this the Citizens Savings Bank and Trust Company of Nashville.

These three men had faith in God and confidence in themselves and the people. Their foresight and courage, their indomitable will-power, their interest in humanity never wavered. If obstacles arose in their path they either went over them, around them or through them. Nothing ever stopped them but death itself, but their spirit still lives and the institution they founded is growing. Because of these virtues, these accomplishments and this record that has seldom been reached and never surpassed, we feel that the people of America would like to honor them with a deposit during the "Deposit Shower Campaign" in the bank that they felt was destined to give recognition not only to our generation but to unborn generations. You can deposit by mail, if you are not living in Nashivlle by sending a money order to the "Banking by Mail Department" of the Citizens Savings Bank and Trust Company, Nashville, Tenn. As little as ten dollars will open a savings account in this bank, after which we will send you a Signature Card and your Savings bank pass-book.

Remember that for three months this "Deposit Shower Campaign," honoring the found er and the first major officers and early stockholders of this Bank, will continue and that you may join in with us in giving them honor.

Friendship

By H. E. Goodloe

Do you have trouble making friends? In your work, do you sometimes feel that you have not a friend in all the world? A few days ago one of my teachers came to the office and said, "I have some thing for you. Read it carefully. It has meant much to me in my dealings with my fellowman." I pass it on to you in order that you may spend a few moments with Sheppard and his treatice on Friendship."

"To have a friend is to have one of the sweetest gifts that life can bring. To be a friend is to have a solemn and tender education of soul from day to day. A friend gives us confidence for life. A friend makes us go outside ourselves. She takes heed of our health, our work, our aims, our plans. A friend remembers us when we have forgotten ourselves. A friend may praise us, and we are not embarrassed; she may rebuke us and we are not angered. If she is silent, we understand.

It takes a great soul to be a great friend, a large catholic steadfast and loving spirit. One to be a friend must forgive much, forget much, forbear much. It costs to be a friend. Nothing else in life, except motherhood costs so much.

It not only costs time, affection, patience, love, but sometimes a man must even lay down his life for his friend. There is no true friendship without self-abnegation, self-sacrifice. One of the dearest thoughts to me is this, that a real friend will never get away from me, or try to or want to.

It is a great and solemn thing to say to another human soul: In this one life we have to live, let us share all things, temporal and spiritual.

Your joys shall be my joys, your sorrows shall be my sorrows. In absence you shall be near me, you shall never be so far away from me but I can hear your voice in the twilight and night session.

Your letters shall make me strong and glad. With you I shall never be greatly reserved. To you I may speed the deep thoughts of my heart. With you alone I laugh, with you alone I may shed tears and not be ashamed. To you only can I say: Behold, here am I an undisguised soul, all others know me in some good mood; you know me in all moods.

Alone

A crowd-pleaser will have had his day when the God-pleaser, mocked of the crowd, is honored forever.

Condensed from Twentieth Century Christian

It is human to stand with the crowd; it is divine to stand alone. It is manlike to follow the people, to drift with the tide; it is Godlike to follow a principle alone.

It is natural to compromise conscience and to follow social and religious fashion for the sake of gain or pleasure; it is divine to sacrifice both on the altar of truth and duty.

"No man stood with me, but all men forsook me," wrote the battle-scarred apostle in describing his first appearance before Nero to answer for his life for believing and teaching contrary to the Roman world.

Truth has been out of fashion since man changed his robe of fadeless light for a garment of faded leaves.

Noah built and voyaged alone. His neighbors laughed at his strangeness and perished in style.

Abraham wandered and worshiped alone. Sodomites smiled at the simple shepherd, followed the fashion, and fed the flames.

Daniel dined and prayed alone. Elijah sacrificed and witnessed alone. Jeremiah prophesied and wept alone. Jesus loved and died alone.

Of the lonely way His disciples should walk He said, "Strait is the gate, and narrow is the way, which leadeth unto life, and few there be that find it."

The Church in the wilderness praised Abraham and persecuted Moses, The Church of the Kings praised Moses and persecuted the prophets.

The Church of Caiaphas praised the prophets and persecuted Jesus. The Church of the popes praised the Saviour and persecuted the saints. And multitudes now, both in the Church and in the world, applaude the courage and fortitude of the partriarch and prophets, the apostles and martyrs, but condemn as stubborness or foolishness like faithfulness to truth today.

The Church in Thy House

By Edward K. Siegler

In the early days of the Christian church, there were no beautiful, stately buildings for worship and teaching. Wherever there was a Christian community, some member who had a spacious home would invite the congregation to worship in a large room of his home. Among the notable homes where the churches met were the upper room in the home of John Mark in Jerusalem; the Roman home of Paul's good friends, Aquila and Priscilla; and the home of Philemon and his family in Colosse. When Paul wrote to his friends, he often used a greeting, "And give my best wishes to the church in your house."

Today, we have beautiful churches, planned for the worship and service of God. But Paul's greeting still has a true word for us. For in a very real sense, there is or ought to be a church in the home of every Christian. What about the church in your house?

No church will ever rise higher than the level of the homes that make it up. As in no other religion, Christianity is based upon lofty home life. All through the Bible, there is strong emphasis upon the home and family as the basic unit in religion as well as social organization. In the Old Testament times, the father of the family was the patriarch, upon whom was laid the full responsibility for the welfare of the children, and the whole household.

Jesus laid much emphasis upon fine home life and the highest ideals of marriage. Paul lifts marriage and home relationships up to the level of the relationships of Christ and the church, and says they should be on that plane constantly—one of mutual love and respect, deference to each other, thoughtfulness, and kindly love.

It is more difficult today to maintain home life on this exalted plane, for there is much competition and much temptation to lower standards to find most satisfactions away from the home and family. But is it more important than ever that our homes be strong centers of the deepest life of our families, and little churches of Christ within the four walls. Therefore, I am appealing to all homebuilders and to all youth who are looking forward to having their own homes: let the church in your house be truly Christian.—Gospel Messenger.

80th Congress, Smeared By Democrats And NAACP Benefited Negro, Says Val Washington

Washington, D. C. — Like the 30th Congress, which the President condemned, the 80th Congress also made its contribution to the improvement of the status of Negroes, Val J. Washington, Assistant Republican Presidential Campaign Manager, **declared today.**

Mr. Washington took exception to a press release by the National Association for the Advancement of Colored People stating that the 80th Congress had failed to enact any legislation of special interest to Negroes. He pointed out that the Taft-Hartley Labor Act protects the employment rights of Negroes. He emphasized the fact that many of the unions which bar Negroes gain their power through closed shop contracts. Only members referred by the unions can be hired. The union accepts no Negroes and therefore refers none. The employer, even if he wished to employ Negro workers, cannot do so. Even unions which admit Negroes—like many of the building trades—have varying policies from local to local. Many Negro skilled tradesmen complain because the union leaders arbitrarily refuse to refer them to a given employer who might be willing to hire them. Under the Taft-Hartley Act Negro workers can apply for employment direct to employers whether or not they are members of the union although the shop is a union shop. The union may then admit him or not, his job does not depend on his membership except for non-payment of union dues if admitted.

It is also important to know that this act prevents an employer from practicing discrimination or discharging a Negro worker after he has been hired solely because the union refused to accept him into full membership.

The Taft-Hartley Act has resulted in being a Fair Employment Practice Act to Negroes in their relation to Organized Labor. In addition to the above it has:

(1) Guaranteed him the right, as an individual, to contribute to and participate in political activities of the Party and Candidate of HIS choice.

(2) Made it possible for him to take a job without first joining a union.

(3) Protected him from being charged a higher fee than other workers to join a union.

(4) Give him the right to vote secretly for or against a "union shop."

(5) Guaranteed him the right to know all the details of his union's finances, expenses, fees, dues, constitution and by-laws, and method of selecting officers.

(6) Outlawed bribes or "gifts" from his employer to his union officers.

(7) Given him the right as an individual to appeal to the National Labor Relations Board for protection of his rights and privileges.

Mr. Washington also pointed out that the 80th Congress had taken two other actions advocated by Negroes.

After the United States Supreme Court had ruled in the Lloyd Gaines case in Missouri, and the Ada Louis Sipuel Fisher case, that a state must provide equal educational facilities within its borders for Negroes or admit them to the State University, fourteen Southern States entered into a compact to utilize Meharry Medical College at Nashville, Tennessee, as a regional school. Congressional approval was sought and the Republican Senate under the leadership of Senator Wayne Morris refused to place its stamp of approval on this effort to perpetuate segregation. It is not difficult to imagine what the results would have been if the Democrats were in control of the Senate.

It is interesting to observe that the fight in the Senate for this nefarious project had the active support of the National Association for the Advancement of Colored People.

Bilbo was prevented from taking the oath of office in January 3, 1947, when he presented himself as the Senator-elect from Mississippi to succeed himself. After a two-day filibuster of Southern Democrats had prevented Republicans from organizing the Senate without seating Bilbo, Senator Alben W. Barkley, of Kentucky, the Democratic Vice Presidential nominee, proposed the compromise which permitted Bilbo to draw his salary and office expenses at the rate of about $37,000 a year until his death, without his having taken the oath as a Senator.

Barkley made his proposal after Republicans had decided to hold the Senate in continuous session through Saturday night and into Sunday, or longer, if necessary, to break the filibuster of Southern Democrats.

The Republican decision to bar Bilbo at the door of the Senate was based on charges growing out of his preventing Negroes from voting in the Mississippi Democratic Primary of July 2, 1946, and his dealings with Mississippi war contractors.

The three Democratic members of the Senate Campaign Investigating Committee filed a majority report holding that Bilbo had done nothing more than to uphold Mississippi law, custom and tradition in his "white supremacy" campaign speeches. Senator Allen J. Ellender, Democrat, of Louisiana, in a speech on the Senate Floor, January 4, 1946, praised Bilbo for the part he played in filibusters against anti-lynching, anti-poll tax and fair employment practice legislation.

The Republican members of the committee, Senators Styles Bridges, of New Hampshire ,and Bourke B. Hickenlooper, of Iowa, filed a minority report in which they said:

"Never to the knowledge of the undersigned has such vile, contemptible, inflammatory, and dangerous language been uttered in a campaign for the purpose of procuring nomination and election by an incumbent and Member of the United States Senate, sworn to uphold the Constitution. Where, as in the case of Senator Bilbo, it goes far beyond mere crudeness and strikes with disturbing force at the bastions of our national solidarity, such speech constitutes a corrupt and flagrant abuse of the right of free speech.

"It cannot be justified on the basis of expediency or tradition, and after the decision of the Supreme Court in Smith versus Allwright, the illegality of advocating exclusion of Negroes from the polls for reason of color or race is apparent. The evidence presented to the committee clearly demonstrates that Senator Bilbo in his primary campaign in Mississippi has violated the Federal Constitution, the Federal Criminal Code, and the Hatch Act, and has aided, abetted, and urged the violation of these laws by officials of his own (Democrat) Party in that State."

President Truman, a former chairman of the Senate War Investigating Committee, who now poses as a champion of civil rights, was singularly silent on the charges of corruption and bribery made against Bilbo by two Senate committees; and certainly no prosecution of Bilbo was ever undertaken by the Department of Justice on the basic of his dealings with war contractors, which Senator Homer Ferguson, Republican, of Michigan, clearly showed, were a violation of Federal law, or on the charges made by Senators Bridges and Hickenlooper.

"On the record, I submit Negroes should vote for Governor Dewey for the Republican ticket in November,' Mr. Washington concluded.

The Life of Victory

Our own helplessness: "Severed from me, ye can do nothing" (John 15:5)

The unfailing source of supply: "My grace is sufficient" (2 Cor. 12: 9)

A reminder of our experience: "Ye are risen with him through the faith of the operation of God" (Col. 2:12)

A wondrous prospect: "The exceeding greatness of his power to usward who believe" (Eph. 1:19)

Personal testimony: "I also labor, striving according to his working, which worketh in me mightily" (Col. 1:29)

Triumph, notwithstanding personal weakness: "I can do all things through Christ which strengtheneth me" (Phil. 4:13)

What's Your Name?

By Lorna Lee Macfarlane, Moody Bible Institute, Chicago

What's in a name? There must be some importance, for consider the hours spent in deciding, "What shall we call him?" Does the name have an important ring to it? Is is in honor of someone? What's the meaning?

Bruce means happy conqueror; Charles stands for noble, spirited and courageous; Donald has the meaning of proud chief.

What about your own name? Do your name and life "match?" If your name is Felix, happy and fortunate, is your life just that? Are you true to your name, if it's Melvin, meaning joyous?

And speaking of names and living up to them, are you known by the name of Christian? Christian is the word "Christ" plus the suffix "ian" which means pertaining or belonging to. Do you have the assurance, down within your heart, that you really "belong" to God? You ought to know, for the Bible says, "He that heareth my word, and believeth on him that sent me, hath everlasting life, and shall not come into condemnation: but is passed from death unto life" (John 5:24). "For ye are all the children of God by faith in Christ Jesus." (Gal. 3:26)

Only if you believe in Christ as your Redeemer from sin, do you truly belong to Him. It is only as you trust in Him in accordance with His word and live to His glory, that you exemplify your name. Do your faith and life show that you are entitled to the name "Christian?"

Autumn-Fire

By David F. Nygren

" . . . The bush burned with fire, and the bush was not consumed." Ex. 3:2.) This Scripture tells of God appearing to Moses in a burning bush in the land of Midian. If our sense of perception were keen, and if, like Moses, we would turn aside" and look, we, too, would find bushes aglow; in other words, we would see God manifesting Himself to us over and over again. Autumn days are especially significant. The trees are putting on a dress of orange-scarlet, a dreamy gorgeousness of coloring. Verily, "every tree is a burning bush." Christ said, "I am come to send fire on the earth; and what will I, if it be already kindled!" (Luke 12:49.) It is kindled, thank God! Let us fan the fire into a worldwide conflagration of evangelistic and missonary effort! This post-war day is indeed a challenge to the church. Every born again believer possesses the Spirit-given fire in his soul, and we are warned, "Quench not the Spirit," (1 Thess. 5:19) in other words, put not out the heavenly fire. The Spirit grieved, He will depart. This holy fire must not be suffocated, it must not be suppressed, it must have "air," yes, expression. "Quench not the Spirit" is a caution against modesty, indifference, and indolence "Let the redeemed of the Lord say so." (Ps. 107:2.) Flare out the message! Let us be "neon Christians." Personal exidence of the power of grace has a wonderful convincing force upon others there is a charm about a Spirit-given testimony that cannot be explained.

Johnson City NAACP Youth Elect Delegate

The youth branch of the NAACP of Johnson City, Tenn., met at the Thankful Baptist Church, Sept. 20, 1948 at 7:30 p. m.,

We elected delegates for the national convention in St. Louis. The delegates were Mr. Iuan Miller, Pres., and Eugene Gaines, chairman of the publicity committee. We are soliciting the aid of the various churches of the city.

Gardening For God

A Christian mother, sowing
Good seed from day to day,
To keep her garden growing,
Must often kneel to pray.

For praying brings God's showers,
Which little gardens need
To fill them with His flowers
And banish every weed.

God's Word is Mother's treasure;
Its precious seed she finds
To sow in fullest measure
In fertile little minds.

The Holy Spirit, leading,
Directs her loving toil,
As daily Bible reading
Sheds sunlight on the soil.

—The Preachers Magazine

The least pain in our little finger gives us more concern and uneasiness than the destruction of millions of our fellow beings.

Lawn Mowers Kill Grasses by Improper Summer Use

By Dr. Floyd Bralliar
Garden Editor
The Nashville Tennessean

July is the month we kill our lawns.

More lawns are killed in July and August than all of the rest of the year put together. We can't understand why so many people persist in doing this when good sense should teach them better, even if they have never read any of the warnings that come from the press, and believe it or not the lawn mower is the weapon most widely used to kill lawns.

For some unknown reason the average lawn mower is set to clip the grass very close to the ground, and strange to say many manufacturers build them so they cannot be set high enough to save the lawn. No lawn mower should be set to cut lower than two inches of the ground, though early in the season the lawn is not seriously injured if it is cut ts close as an inch and a half. But think what happens when a lawn is cut very low, especially if the clippings are raked up and removed. Grass roots are formed to do well in the shade, and are especeally sensitive to direct sunshine.

Sunshine Damages Roots

Imagine what happens to them when their dead shade is suddenly removed and the full sunlight falls all around the base of the plant. As long as the weather is cool, the days short, and rainfall plentiful, new growth starts almost immediately and the roots are again shadowed before they have been seriously damaged. But with the arrival of the longest days in the year, the burning hot sunshine and the shortage of rain, the story is quite different. Blue grass is especially sensitive to the effects of too-close mowing.

Properly fertilized, properly mowed, and reasonably cared for blue grass will form a dense sod and crowd out amost all undesirtble grasses and weeds, but we seldom see any blue grass lawns anymore, largely because of the effects of too-close mowing.

One of the most important things to do with a lawn especially at thes time of the year is to get rid of the weeds. We have just read a trite statement of the best method of getting rid of weeds. We quate, "2-4-D is the new wonder weed killer for lawns. It comes under various trade names and most brands are okay. Buy from a reliable firm and follow directions. Broad-leaved weeds and wild garlic succumb, leaving the grasses. It does not kill crab grass which may be smothered out with a piece of tarred paper, canvass or old rug. Crab grass can't stand shade. Unfortunately, 2-4-D also kills clover and other useful plants, so care must be used. There are other good weed killers on the market."

Give Weed Killer Time

Don't expect 2-4-D, under whatever trade name you use it, to kill your weeds in a minute. This material is absorbed by the leaves of the plant and is circulated in the sap, an dit is not until this takes place that the plant is actually killed. If the plant is young and vigorous and growing rapidly, this may occur in 4 or 5 days, but it often requires three or four weeks to kill plants in a semi-dormant stage. It would be well to water all lawns thoroughly two or three days before treating them with 2-4-D to start new growth in the plants we wish to kill.

Mid-September is the best time of the year in many parts of our country to reseed our lawn or to sow a new one. If we kill our weeds now, we should soon have our lawn in first class condition and it will be all ready to reseed where needed by the middle of September.

It is always well to fertilize the lawn about a week before we expect to reseed it. Water it thoroughly. This will furnish foor for new seedlings just at the time they neet it most.

Spraying Cattle

Now is the time to spray cattle for horn flies, stable flies and mosquitoes. These pests cause cattle much misery and prevent them from gaining as they otherwise would. Use one pound of 50 per cent wettable DDT powder to four gallons water and apply this to the cattle. Use either a bucket and rag or a hand sprayer for a few cattle. If the number of cattle to be sprayed is large use a power sprayer. This spraying will make cattle gain weight faster. It will also reduce the hazard of disease. Many diseases are carried by these parasites. Do a thorough job of spraying. Spray all livestock and outbuildings and rid the farm house of flies and mosquitoes. Thorough spraying will last for many weeks.

Garden Profits

Better meals for less money—that's what every family wants these days. And that's what a home garden can furnish. Even a small garden on a town or city lot, if properly managed can furnish from $50 to $75's worth of vegetables a year, garden specialists of the U. S. Department of Agriculture estimate. Larger gardens, especially those on th farms, can provide even more.

Vegetables right out of the garden make meals look better, taste better and offer more vitamins because they have full freshness. That adds up to better appetites and better nutrition. Many families not in the habit of eating many vegetables have learned to like them by growing their own and have improved their diets accordingly.

Home gardens promote family health not only by adding to the nutritive value of meals but also through outdoor work of gardening itself which all members can take part in with benefit to themselves and the budget.

Southern farmers owe Senator Stennis of Mississippi a vote of thanks for his recent action which will prevent the shipment of a large portion of the nation's limited supply of winter legume seed to foreign countries.

The Department of Agriculture has promised Stennis that no export quotas will be set for legume seed.

This will enable farmers to obtain neccssary seed for fall plantings and prevent unwarrented high prices which often result when scarce items arc exported.

Senator Stennis realizes that the failure of Mississippi farmers and others throughout the south to seed the legumes will not only result in loss of feeds but will cause the loss of millions of tons of needed plant food through erosion.

Negro Home Ownership Tops White

Chicago,—"One out of every three Negro families in the U. S. today owns the house they live in," a Noveember Ebony feature declares, "with the result that Negro home ownership is proportion ately greater than that of whites, according to the Federal Housing and Home Finance Agency."

Avid hunger of families for a home of their own and increased investment of millions of dollars in property by wealthy Negroes are the two factors most responsible for this increase in Negro home ownership, the Ebony story entitled "Real Estates" avers. However, the article adds, despite these advances the demand is still tremendous because of the big gain in Negro population in urban areas.

"The number of Negroes in these areas rose by a third in the last seven years but dwelling units for them rose only by a fourth," Ebony says, and adds:

"This boom in real estate in Negro communities has brought a bonanza to the nation's 5000 colored realty brokers whose yearly sales volumn now tops the billion dollar mark."

The magazine also predicts that the Supreme Court decision against restrictive covenants will open many new fields for Negro realtors and an even bigger year will follow in 1949.

Christ And The Community

Theme Chosen For Educational Week By Religious Forces

Forty Denominations; Thousands of Communities and Tens of Thousands of People.

Chicago— "Christ and the Community" will be the theme of the 18th Annual Observance of Religious Education Week, which will be held Sept. 26th through October 3rd, it was announced here today by Dr. Roy G. Ross, general secretary of the International Council of Religious Education.

Celebrated by 40 denominations, thousands of communities, and tens of thousands of churches, Religious Education Week is the period when Protestanst of United States and Canada begin their religious education activities for the fall and winter months.

"The event offers Christian educators and church leaders a splendid opportunity to demonstrate to all Americans and Canadians by a united observance the great importance of Christian teaching," Dr. Ross announced.

Themes and emphasis for each day of the weak are as follows:

Sun., Sept. 26 — "The Community Needs Christian Teaching," featuring Rally Day or Promotion Day.

Mon., Sept. 27— "The Community Requires Christian Leaders," featuring church school leaders' conferences.

Tues., Sept. 28—"The Community Depends on Christian Homes," featuring family night at church.

Wed., Sept. 30—"The Church, Example for the Community," featuring parish or interchurch meetings

Thurs., Sept 31—"Church Cooperation for Community Service," featuring interchurch conference, especially dinners for all Sunday School Superintendents **interchurch youth rallies.**

Sat., Oct. 2 — "The Community Needs Christ," featuring spiritual retreats and completion of home visitations.

Sun., Oct. 3 — "Christ and the World Community,' featuring World-wide Communion Sunday.

Plans for observing the week have been worked out by the denominations and councils of churches for use in local churches and communities

When you are canning, try using a "chopping board". This is simply a board of hard lumber on which to place your vegetables to chop them up for canning soups, kraut, and mixed vegetables. You will find this board a real time-saver.

Christianity And Recreation

(By H. E. Goodloe)

Not long ago the writer was confronted with some questions that were puzzling and most certainly food for thought. In this discussion three of the questions are considered: (1) Why study Christianity? (2) Why does the Church frown on a majority of the amusements of youths? and (3) Can you have good religion and be a part of the world?

These questions came from a youth who had been exposed to an environment of a Christian home, he had been a member of a Sunday School since early childhood, and is now a member of the Church. In addition, he is a member of the local high school, and ranks slightly above the average in his class work. He was sincere to the extent that at the end of the conversation, the writer was thinking in terms of the following questions: (1) What type of religious education program did this boys church have? (2) If such a program existed in this church, did it need re-organizing? (3) Did the church have a planned recreation program for its youth? and (4) What is really meant when we refer to a thing or person being worldly?

In short, here was a youth coming from a supposedly religious home, a regular member of the Sunday School, a member of the church and yet was a very much confused person. Would it be wrong to assume that there are several thousand youth in a simular position scattered throughout this great Christian United States? Not only youth but adults as well?

WHY STUDY CHRISTIANITY?—One writer said, "We study Christianity in the hope of discovering in it a power which can meet manifest needs of energizing the public conscience to persistent and fundamental activity in the full solution of the problem." Since the youth of today are the adults of tomorrow, then it seems logical to reason that the study of Christianity is essential to rediscover its positive message to the spontaneous interests of youth. Finally, a sound philosophy behind the study is that it is an open fact of history that the teachings of Jesus have already given moral guidance to countless individuals.

WHY DOES THE CHURCH FROWN ON A MAJORITY OF YOUTH'S AMUSEMENTS?—Strange as it may seem, but it is evident that all of the major questions of young people's lives are closely related to their amusements—the best gifts of life, are all bound up with them. All of their personal moral questions are colored by them, and these questions have become exceedingly complex in the face of commercial offerings. This makes the amusements of young people under the conditions of modern life, especially in cities, a paradoxically serious matter. Over a long period of years it has been somewhat traditional to think of Jesus as one who never smiled. Monks, and Nuns, Jacobin and Puritan, with a host of others, have through the years marched past the eager spirit of youth in stern procession thinking thereby to do him reverence. In short, youth has been identified with repression and restraint. Mirth and a lively spirit have been accounted unbecoming in the Saints. But what about Jesus?

CAN WE HAVE GOOD RELIGION AND BE A PART OF THE WORLD? — What do we mean by being a part of the world? We are born into the world, we live in the world and finally we die and the mortal frame goes back to the dust from whence it eame. Then why is it harm to become a part of the world in which we live and have our being? What about Jesus? History says he was no escetic. Intensely interested in his task, He dignified every normal impulse and recognized for each true expression. He accepted invitations to feasts, went to a marriage, dined with the hospitable Pharisees, was a frequent visitor at the house of Mary and Martha at Bethany, and his enemies once referred to him as a gluttonous man because he was so unlike John. A study of Jesus reveals the following: (1) He relished the out doors; (2) had companionship with children; (3) and had a radiant personality. Read some of his messages of happiness, "Blessed are ye that weep now, for ye shall laugh." "Rejoice and be exceedingly glad." "I will see you again, and your heart shall rejoice, and your joy, no one taketh away from you."

In a more serious vain, he fed a multitude of hungry people with five loaves and two fishes, and at another time he was hungry and refused to feed himself at the suggestion of Satan. All of these things happened in this world in which Jesus was a part. Why did he feed the multitude? Simply because it furnished an excellent opportunity to render a worthwhile service. Then next, why did he fail to feed himself when he was hungry? Simply this, He was tempted by Satan whose motive was impure.

Then from this discussion, the writer comes to this conclusion, "Like Jesus, we are a part of this world." In work or in play, what about our motives? Are they pure or impure? Modern invention has brought more leisure time than ever before. How shall youth spend this leisure? Is the church interested? Should more emphasis be placed on the recreational activities of youth?

Apples Are Sourest Near the Fence

The Gospel Messenger remarks that Charles Spurgeon used to tell the story of an American who had a great apple orchard. This apple fancier had insisted over and over that a friend of his should come by and sample his fine fruit.

Finally, the friend admitted that he had already tasted the apples and that he did not care for any more of them. Said he, "As I went along the fence, I picked up one that had fallen outside, and I never tasted anything as sour in my life."

The gardener replied, "I thought it must be so. Those apples around the outside are for the special benefit of the boys. I went fifty miles to select the sourest sort to plant around the outside, so that the boys would give the rest up as not worth stealing." Then he went on, "But if you will, come inside, you will find that we grow a very different quality there — sweet as honey."

There are thousands out in the world who, as blindly, are judging the church life of today by the quality of those who are just on the fence—right near the edge—neither in nor out—Western Recorder.

The National Council Of Negro Women, Inc. To Meet Oct. 10-13

Washington. D. C.—One of the most colorful features of the 13th Annual Convention of the National Council of Negro Women to be held here October 10-13, will take place on its famed "International Night" program to be given in the Inter-Departmental Auditorium of the U. S. Department of Labor on the evening of October 12.

More than 1,000 delegates and members of the NCNW together with Ambassadors, Ministers and attaches from 30 foreign countries will witness a One World Concert presenting the music and art of the various nations, races and creeds of the earth.

High ranking diplomats from Great Britain, Finland, Ethiopia, Australia, Haiti, Guatemala, Denmark, Austria, Costa Rico, Bolivia, Yugosalavia, Latvia, Switzerland, the Dominican Republic, Colombia, Lithuania and Hungary will be among those in attendance.

The theme of the four-day convention as announced by Mrs. Mary McLeod Bethune, Founder-President of the NCNW, will be "World Citizenship Through Human Understanding."

The most important single issue before this convention will be human and civil rights," Mrs. Bethune stated, "and so that the viewpoints of Negro, white and foreign women in their mutual struggle for these rights can be expressed simultaneously in an open forum, we have planned a monster mass meeting for the afternoon of Sunday, October 10, in the Auditorium of the Department of Commerce."

Speakers at this meeting which is open to the public will include Madam Rajan Nehru, wife of the Indian Minister to the U. S.; Dr. Sadie T. M. Alexander, a member of the President's Committee on Civil Rights and Dr. Ethel J. Alpenfels who is Associate Professor of Education at New York University and a member of the Human Relations Committee of the NCNW.

The Need to be Quiet

We are a noise-ridden people. It is not easy to find a place where one can be absolutely quiet. The new sound devices which enable noise to be carried everywhere, to penetrate walls, and even floors, make life miserable for those who love quiet. The soul needs periods of quiet—undisturbed reflection, earnest inner thoughts, and prayer. "In quietness shall be your strength." It is a peculiar psychology that seems to want perpetual noise. "Sometimes I should divide the world into those who like noise and those who love quiet," writes G. B. Stern in her latest book, TRUMPET VOLUNTARY (Macmillan). "People who like quiet are self-sufficient and therefore unneurotic; they can bear to think, and do not have to arrange for the drowning of thoughts like a litter of unwelcomed kittens the moment they are born. The tendency of an entire generation not so much to turn on the wireless, as to LEAVE on the wireless, leave it on when they go out and hear it ring when they return (or rather, not hear it, for noise has numbed their ability to hear) reveals something so maladjusted and unbalanced that it should be traced to an original cause and dealt with by qualified psychotherapists as though it were a disease affecting the national health."

Shaw University News

Raleigh, N. C.—Students of Shaw University began the work of the current term Wednesday. The Shaw student body includes nearly 300 freshmen who Tuesday evening finished a week of orientation activities. New students completed registration Monday morning following a meeting in Greenleaf Auditorium where instructions in registration procedures were given them by Mrs. Eva F. Ray, University Registrar.

Other talks on several phases of life at Shaw University were made during the orientation week by officers of the administration and department heads. High point of the week was the service Sunday evening at 7:30 in University Church which featured an address by President Robert P. Daniel on "The Spirit of Shaw University."

Earlier in the series Dean Foster P. Payne lectured on "Objectives in Education and Curriculum." Dean W. R. Strassner of the School of Religion spoke on "Religious Emphasis," and Miss Sadie Eaton, R. N., spoke on "Health Services and Policies." The "Use of the Library" was explained by Miss Thelma C. Nelson, University Librarian. Also figuring prominently in the orientation were, G. E. Jones, business manager; Miss Carrie L. Harrison, Dean of Women; and Caswell M. Carter, Men's Proctor.

All freshmen were given an English examination and a psychological test prior to registration Other than the serious testing business, their week was completely entertaining. Special social features included, a Get-Acquainted social, a community sing, and a recreation night. The annual Talent Night presentation came Monday evening and the All-University Reception was held Wednesday night in Spaulding Gymnasium.

Dr. Hubert H. Creft, a Shaw alumnus and a prominent physician of Monroe, told students of Shaw University "opportunities for the prepared Negro are unlimited." Dr. Creft, who delivered the annual address at exercises marking the formal opening of the 84th academic session at Shaw, warned his hearers to guard against being misfits. "Select the trade or profession that best suits you and dignify it with work and character," he urged.

Many trained men and women refuse to go to small towns or backward sections because such places lack cultural and social contacts the speaker said. He appealed to students to "go where the need is great and create your own facilities. Go to the dark areas where ever they may be and redeem human resources, not exploit them, and lead the people to higher levels of Christian civilization," he concluded.

Dr. Creft was introduced by President Robert P. Daniels, who earlier had made the traditional school opening statement. He told students, "Only the individual, not the institution, can guarantee an education," and urged them to "refuse to be shortchanged in education.

Shaw University Department, J. W. Wallace, Director.

National Health Insurance

Summary of Recommendations Urged By Federal Security

Complete Medical Service For Every One Without Regard to Race or Religion

"The earliest possible enactment of Government health insurance" is urged by Federal Security Administrator Oscar Ewing as the "best means" to realize the nation's health goals of "complete health and medical services for every man, woman, and child, without regard to his race or religion, the color of his skin, his place of national origin or the place he lives in our land, and without regard for his personal economic status."

In his extensive 168 page report drafting a ten-vear national health program, Ewing advises the President that he can see "no other possible way of bringing adequate medical service to fully half of the American people." He warns that 70,000,000 Americans cannot now afford to pay for adequate medical care.

The National health Insurance program outlined by Ewing guarantees free choice for both patient and doctor. It would be financed for the first three years by a one-half or 1 per cent contribution on the first $4800 earned in a year, this contribution to be made either equally by employer and employee or as might otherwise be prescribed by law. In subsequent years, the rate of contribution would rise. He also recommends that the program be "administered through Federal-State-local cooperation so that the keynote is decentralization and local participation."

In the first "time-table" ever prepared for National Health Insurance, Ewing recommends immediate legislation and then a three-year "tooling up" period to break professional and other bottlenecks.

The report early emphasis the toll which insufficient medical care exacts from Negroes: "The death rate for Negroes in 1945 was almost 50 per cent higher than for whites. when corrected for age distribution —13.6 per 1,000 for Negroes, 9.2 per 1,000 for whites.

"Life expectancy for Negroes at birth is 17 per cent less than for whites. The same disparity exists in records of childbirth. In infant mortality, the national rate was for whites 31.8 deaths per 1,000 live births: for Negroes 49.5.

"In South Carolina, the mortality rate for white mothers was 1.3 per 1,000 live births, for Negro mothers it was 3.6 per 1,000 births. This 170 per cent higher mortality rate among Negro mothers can be related to the fact that a scant 14 per cent of Negro births occurred in hospitals and 65.9 per cent were attended merely by a midwife or other unspecified person. By contrast, only 2.5 per cent of white births were in this latter class."

His report emphasizes that health needs are also given in rural areas and among all low income groups. Ewing cites the higher death rate and material and infant mortality rates in the poower Southern states as compared with the much lower rates in the richer industrial East as evidence that income directly affects health.

Ewing asserts that revision of the American Medical Association's 1939 research figures to allow for the intervening rise of approximately 75 per cent in the cost of living indicates that families with an income below $5,000 cannot now meet serious sickness costs without outside aid. "Narly 80 per cent of our families (112,000,000) earn less than $5,000 and consequently would have difficulty meeting the costs of a serious or prolonged illness.

Ewing states that voluntary insurance programs alone cannot provide enough medical care at low enough rates to the entire country. Despite the "solid achievements" of the voluntary plans, he points out that less than 3 per cent of the population is covered by comprehensive health insurance.

"As measured against national need, the voluntary insurance plans show these deficiencies: "They offer benefits that are inadequate. They cover only a fraction of the population, and will never be able to cover more than half of the total population"; (2) "They have the poorest coverage where the national need is greatest," in low income areas; (3) "the voluntary insurance plans can never do the job that the national interest requires to be done."

The recent Brookings Report, which doubts the need for National Health Insurance, is rejected by Ewing. He avers that American health, while good, "has serious deficiencies."

A four-phase "time-table" for a national health program is presented: (1) Passage of Federal legislation and setting broad policies (2) A three-year "tooling up" period to establish procedures and coordinate services. (3) Initial operation geared to existing facilities; (4) Ultimatte expansion to include complete medical coverage for everyone.

The report also says: "The law should make special provision to meet the needs of rural areas and the urban centers which serve them." Particular flexibility is advocated to assure "steady financial support in areas that previously have lacked the funds to attract personnel or to finance facilities." Financial aid for medical education and for research is also urged. Ewing declares that these measures "would give the farm population a square deal in medical services for the first time in our Nation's history."

Ewing rejects sharply the contention that National Health Insurance is "socialied medicine" and points to the guaranteed freedom of choice for both doctors and patients and to the strict curbs he proposes be placed on federal powers.

After a careful weighing of the facts, Ewing concludes that in regard to the quality of medical care, the plan "for a Government system of prepaid insurance would for the Nation as a whole, work toward a vast improvement."

Did winter grazing crops save you feed? Did they increase your cow's milk production? Now is the time to plan your grazing crop for next fall and winter. Decide what you will plant, where, and how you will prepare the land.

Combine cooked noodles with butter or margarine (melted).

Grapefruit juice may be combined with ginger ale and ice for a cooling drink.

Rev. J. G. Reese Offers Remedy

The Sunday School Can Help Stop Juvenile Delinquency

Elba, La.—(Special)-One of the well known ministers of this part of Louisiana has just submitted his recommendations and his observations on a topic that is challenging the best minds of our country today. In his article he says:

"The criminal is the product of spiritual starvation. Someone failed to bring him to know God, love Him and serve Him. As a result, the criminal's mental attitudes and action are guided by a selfish individualism. He has no respect for the law—he hates it. Moral traditions are subject to his scorn as he declares war on society.

Unfortunately, there are many in our country today who mock the law of both God and man.

A Shocking Record

The gravity of the crime situation in 1946 was reflected by the fact that during the average day, 36 persons were slain, 33 were raped, and 185 others were feloniously assaulted. During each 24 hour period on the average, 172 persons were robbed, 981 burglaries were reported to the police, 630 cars were stolen, in addition to 2580 miscellaneous larcenies of various types being committed. It is significant to observe that every 5.7 minutes in 1946 there was a criminal homicide, rape, or assault with intent to kill. The rise in crime during 1946 revealed that we are still faced with an abnormally high rate of juvenile misbehavior.

The Initial Responsibility

Criminals are not born. They are the product of neglect, the victims of indifference, the results of an age which has tossed morality in the junk yard. Moral chaos and crime run hand in hand as they eagerly attempted to destroy, peace, order and happiness. If we are to get down to fundamentals in approaching the problem of crime it is necessary to begin to build the spiritual structure of the child at the cradle. The responsibility rests initially with the parents. The home must be the first great arena of teaching. In the final analysis, the child who fails to learn honesty, discipline and respect for authority from his parents can quickly become exposed to the virus of crime.

Unhappily, there are many homes where parents are untrained in their obligations to their offsprings; where unguarded talk is as regular as three meals a day; where childish independence is encouraged, and refracotry conduct is condoned; where breaches of discipline and anti-social whims are overlooked; where God and religion are considered too old-fashioned in an age dedicated to materialism. The children of such homes need help and the Sunday schools can do much and are doing much to bring God and religion in to the starved souls of the youngsters.

Our Sunday schools are not sending forth children who easily succumb to life-wrecking temptations. Instead the boys and girls who have gone to Sunday school have been well prepared for the entire span of life. The Sunday school is a citadel of real spiritual infulences. Religion to a boy or girl becomes a reality based on love and not on fear. Youngsters come to know that God asks more than mere lip service to His commandments; that He asks us to live under His guidance and love. The Sunday school teaches the power of prayer and the need to make God an intrinsic part of our daily lives. The Sunday school teaches the child to "rule his spirit, and to place a reliance upon God which will not be shaken in later years. It stands as a strong bulwark against the angry waves of evil, presently sweeping across our country.

It is a powerful medium in materially reducing the army of youthful offenders and delinquents.

I would like to pay tribute to the thousands of loyal men and women who are serving so unselfishly as teachers in our Sunday schools. Those who have the task of enforcing the law should look upon them as companions in arms in the fight against crime. As true crusaders for Christ the Sunday school teachers want the nation's children to be honest, truthful and unselfish. They are convincing youngsters that right habits, attitudes and appreciations are necessary attributes for decent living. They are in the front ranks of the great army who are courageously fighting to free our country from dishonesty, selfishness, greed and moral instability. In recruiting for God, they are building for America.

More often than not a child is first introduced to the Bible by a Sunday school teacher. It is quite impossible to believe that progress along the road to righteous living may be accomplished without the guidance of the Bible. The Bible is the source of spiritual food, the solution of life's problems, and the inspiration for Christian living.

"Man shall not live by bread alone, but by every word that proceedeth out of the mouth of God" is a precept which must be followed by all if life is to have a meaning. Our forefathers believed in the inspired Word of God and their religious faith and simple devotion produced a strong character.

If we are to make progress in the fight against crime, let us make sure that our children attend Sunday school.

It is difficult for me to understand why so many mothers and fathers refuse to afford to their children the wholesome, healthful character-building environment of the Sundy aschool. Proverbs 22:6 tells us to train up a child in the way he should go, and when he is old he will not depart from it. May all parents in the land heed this advice from the wise man. If they will heed this warning we will soon see evidence that the Sunday school is an essential factor in curbing juvenile delinquency. If there is one class for whom the Bible has a special message, and to whom the religious appeal is especially directed, it is youth. The founder of Christianity, Christ himself, was busy about His Father's business at the age of twelve. He had a definite program which he fully knew and from which he could not be deflected by even his dearest friend. The relation of youth to Christianity is written all over the letters of Paul to Timothy, but there is one particular charge given to youth by the ablest exponent of Christianity which cannot escape our attention.

Here it is: Let no man despise youth, but be thou an example to them that believe, in word, in manner of life, in love, in faith, in purity." I Tim. 4:12.

J. G. Reese,
Elba, La.

Teen-Age Drivers Most Reckless

Chicago, Ill.—Are teen-age drivers, regardless of race or color, as reckless as older folks say they are? The National Safety Council, this week, says the answer is "yes."

The 1948 edition of "Accident Facts," the Council's statistical year-book includes studies made of accident rates of drivers in various age groups. These studies show that the fatal accident rate in terms of miles driven by youngsters under 20 was 89 per cent higher than the average rate for all drivers.

The Council believes driver training courses in high schools and colleges are a big part of the answer to the problem. Better examples by parents and other older drivers would help a lot too, it says.

Officers, Executive Committee And Directors Meet

Money Loaned, Funds Raised Are Invested In First Mortgages

Members are still being accepted in the Denominational Trust Association, a Tennessee Corporation, organized solely for the purpose of taking first mortgages on churches when they are threatened with foreclosure. When the charter was issued several years ago for this non-profit, eleemosynary organization, which was distinctly instituted, and was so stated in the Article of Incorporation, that it was for the purpose of taking up these mortgages. The money raised to operate on comes from its members. The membership is in two classes; the ten dollar class, which will entitle that member to lend the organization one hundred dollars, and the class whose membership dues of one hundred dollars, allowing that member to loan the corporation one thousand dollars. The money thus borrowed is secured by the Association pledge to use it five or ten years, for which the members receive a dividend of 6 per cent.

"The purpose in the outset," declared the officers here in this city, "was to get one thousand persons to agree to loan the Denominational Trust Association one thousand dollars each." This gross amount, which would total one million dollars, will still be ear-marked and all invested, not in furnishing money to build a new church or in furnishing funds to complete a church, but for the purpose of taking over mortgages, if and when the property is completed, and after a clear title through some title company is secured showing that there are no clouds on the title, or when the abstract is gotten and brought down to date, showing that there are no judgments resting against the property. Last, but not least, when the congregation passes a resolution authorizing the officers to make such a mortgage, but giving the Denominational Trust Association permission to take up such a mortgage. The Association also requires that the property be insured in some reliable insurance company, full coverage to the amount of money involved in the mortgage.

The president of the company stated several weeks ago that they had taken mortgages on more than four hundred thousand dollars worth of property in the states of Alabama, Kansas. New Mexico and Tennessee, and that eight or ten applications are still on file pending investigation, so that a report could be made to the executive committee for final action. He said: "We are still inviting people to become members of this corporation so that additional funds can be loaned us to prosecute the work. No money will be lost, but every time is secured by this first mortgage. He declared that there are no salaries paid and no overhead, that the only expenses charged to the Association is stationary, printing, postage and legal service.

It is understood that the membership in the United States is from the Atlantic to the Pacific, from the Great Lakes to the Gulf, and that it is made up of men and women in the various states. He also expressed confidence that before another year rolls around the Denominational Trust Association will not only have the one thousand members for which the goal was set, but that they will have raised the million dollars that they set out to raise, all of which will be invested and secured in first mortgages on church and educational property.

Life is thick-sown with thorns, and I know no other remedy but to pass quickly through them.

True Prayer

Prayer is described in many ways, and many beautiful things have been said about it. But one thing that must always be true of sincere prayer is that it grows out of the atmosphere of complete surrender of our own wills to the holy and perfect will of God. In all of our prayer life, we must follow the example of Christ, who in the hour of His deepest agony in the Garden of Gethsemane could still say, "Nevertheless, not my will but thine be done." To fail here is to fail to pray as we ought. No matter how important or wise the thing which we desire and for which we pray may seem to us, if it is not in accord with the will of God, it can never be the thing that is right or best for us.

—Christian Observer

Doris Ann's Secret

By William Howard Church

Doris Ann smiled and picked up another magazine from the floor. "Clip! clip!" went her scissors.

"Where did you say you were going?" Peter aswed her again.

Doris Ann had just told her friend, Peter, that she was going around the world. He didn't seem to believe her!

"I said around the world,'" she repeated solemnly.

Peter gasped, and his brown eyes grew big with amazement.

"Oh, not **really,**" laughed Doris Ann. "You see, it's a game I play!"

Peter laughed to. It was a good joke on him.

"Then may I play it with you?" he asked politely.

"Of course," replied Doris Ann. "You'll find a pair of scissors in the top drawer of the desk."

Peter got the scissors.

"Here are some magazines," Doris Ann continued. "You must look through them and cut out all the colored pictures of far-away lands and their people. Pictures of boats and airplanes are good, too."

"What about trains?" asked Peter.

"Oh, yes," said Doris Ann. "I forgot to mention them, I guess."

So Peter cut out a fine picture of a train he had just found. He wanted very much to ask Doris Ann why they were doing this. It was fun, of course. But Doris Ann was keeping something secret, so Peter said nothing.

"My! Look at this lovely white palace!" sighed Doris Ann. "It's called the Taj Mahal, and it's in India. I'd love to go there!"

"Look at this boat!" cried Peter, excitedly. "It carries fruit all the way from South America! Wouldn't that be fun?"

So the children cut out picture after picture. And all the time it was just like traveling because they imagined themselves in all the places the pictures showed to them.

Finally, Doris Ann stopped cutting and began counting the pictures. There were thirty-six in all.

"I think we have enough now, Peter," she said. "You spread out a newspaper while I go get some things we'll need."

When she came back, Doris Ann was carrying a jar of paste, several pieces of thin cardboard, and some sheets of colored paper.

She began folding the pieces of cardboard into three parts so that there were two flaps that crossed over a center strip.

Peter helped her without asking any questions, but he was very curious.

When the folding was done, they spread paste on the outside of the cardboards. Then they covered these with colored paper. Some they made blue, some red, and a few yellow.

"Now we paste the pictures on the inside," explained Doris Ann. "Do you know what they are going to be?"

"Why, they're just like travel folders!" Peter exclaimed at last. "Daddy gets them sometimes, that's how I know. They tell all about places to travel."

"That's right," smiled Doris Ann.

"But what are you going to do with them?" asked Peter.

"That's a secret!" his friend laughed. "But you'll find out later."

At last they finished the folders. They were very pretty with their colored backs and bright pictures. There were a whole dozen of them.

"Now we're ready to deliver them," said Doris Ann, beginning to tell the secret.

She drew a list from her pocket.

"We'll start with Molly Brown. She's in bed with a cold. Then the are lost of others who are sick."

"Oh, what a fine idea!" declared Peter, putting on his coat. "And a good secret, too!"

Doris Ann felt happy. She was glad that she had thought of a way to help her friends get well and be able to "see the world" while they were doing it."

—Story Time.

National Woman's Council To Meet On October 10

Washington, D. C.—The 13th Annual Convention of the National Council of Negro Women will be held here at the Inter-Departmental Auditorium of the U. S. Department of Labor, October 10-13.

Mrs. Mary McLeod Bethune, Founder-President of the Council today announced that on October 11 the convention will be addressed by Secretary of Labor Maurice J. Tobin, Miss Frieda S. Miller, Director of the Children's Bureau of the Department of Labor and Miss Katherine F. Lenroot, Chief of the Children's Bureau of the Social Security Administration.

The theme of this year's convention, "World Citizenship Through Human Understanding," will be developed before some 1,000 registrants from the U. S. and several foreign countries, Mrs. Bethune added.

"Who Gave Himself For Me"

"I am crucified with Christ: nevertheless I live; yet not I, but Christ liveth in me: and the life which I now live in the flesh I live by the faith of the Son of God, who loved me, and gave Himself for me."—Gal. 2:20.

Gave His Head to Wear Thorns for Me

"And the soldiers platted a crown of thorns, and put it on His head." —John 19:2.

Gave His Eyes to Weep Tears For Me

"And when He was come near, He beheld the city and wept over it."

Gave His Tongue to Pray for Me

"Then said Jesus, Father, forgive them: for they know not what they do."—Luke 23:34.

Gave His Side to the Spear for Me

"But one of the soldiers with a spear pierced His side, and forthwith came there out blood and water."—John 19:34.

Gave His Hands And Feet to the Nails for Me

"And when they come to the place which is called Calvary, there they crucified Him."—Luke 23:33.

Gave His Precious Blood For Me

"Take heed therefore unto yourselves, and to all the flock, over thee which the Holy Ghost hath made you overseers, to feed the churfch of God, which He hath purchased with His own blood."—Acts 20:28.

Gave His Life For Me

"I am the good shepherd: The good shepherd giveth his life for his sheep."—John 10:11.

Gave All His Riches and Became Poor For Me

"For ye know the grace of our Lord Jesus Christ, that though He was rich, yet for our sakes he became poor, that ye through His poverty might become rich."—II Cor. 8:9.

Will Never Rest Until He Comes Again For Me.

"And if I go and prepare a place for you, I will come again, and receive you unto myself; that where I am, there ye may be also."—John 14:3.

You cannot have the Truth without Christ, for Christ is the Truth.

Says Passage Of Bill Will End Job Discrimination, Bring Labor Peace to South

Father O'Connell Delivers Pointed Address In Monroe, Louisiana

Monroe, La., (Special)—Fair employment practiccs and an end to job discrimination will form one of the major steps to bring labor peace to the South, the Rcv. Vincent J. O'Connell, S. M., told a labor-management conference here recently.

"Southern employers and Southern unions must re-examine and revise employment practices now resulting in discrimination," said the New Orleans priest.

"Both emlpoyers and union bargaining agents must seek to include in collective bargaining contracts, provisions for equal pay for equal work and cqual opportunity to work."

Father O'Connell delivered the principal address at the final session of the conference in which union officers, emloyers and Louisiana statc officials joined to exchange ideas and viewpoints.

He appeared as general chairman of the Catholic Committec of the South, the organization of Catholic priests and laymen seeking to awake thc South to the Catholic teachings of racc, labor, economic and social justice.

In regard to FEPC, he declared: "It is no answer to the problem to say that the federal government has no right to interfere.

"Job discrimination must bc ended. And if we Southerners do not end it ourselves we cannot be sincere in saying that the federal government must keep hands off."

His demand for FEPC principles was listed às one of the ten steps to labor-management peace. Others included full organization of labor; vigilancc against futurc anti-union legislation; business, labor, agriculture and government joining in economic councils, and substituting organized cooperation for present day competition.

Father O'Connell cited the statement of Pope Pius XI that economic life attains its purpose only "when all and each are supplied with all the goods that the resources of naturc . . . can furnish."

Nearly 60 Percent Of Farms In South Now Electrified

The farms of nearly 300,000 additional white and colored families in the South were electrified last year in a record increase of rural electrification, the U. S. Department of Agriculture announced last week.

This expansion of electric service brings thc total number of farms in the South receiving central station power to 1,685,684 or nearly 60 percent of the farms in that region. However, there still remains 1,186,155 unelectrified farms in the South, making up 64 percent of all unelectrified farms in the United States.

For the Nation as a whole, 4,019,476, or 68.6 percent of the farms are now electrified. Ohio leads with 97.6 percent of its 220,000 farms electrified, while North Dakota, South Dakota, and Mississippi lag fartherest behind.

To help further extend electrification into farm areas, Congress has authorized for the current fiscal year a loan fund of 400 million dollars, of which half is being reserved for the States on the basis of need as revealed by the annual unelectrified farm survey made by Rural Electrification Administration.

Largest allocation of funds, $17.873,420, has been earmarked for Mississippi, where 164,408 farms remain unelectrified. Second largest allocation goes to Texas which has 127,546 unelectrified farms.

Although the South still lags in rural electrification, the REA survey shows that the greatest gains in farm electrification last year were made in that region. Texas led with the extension of lines to 43,000 new consumers, North Carolina was second with 38,000, and Virginia was third with 33,000.

For the South as a whole, 290,845 farms were electrified last year. This compares with 153,990 for the rest of the country. REA financed rural power distributors reached 320,677 of the 444,835 new rural users.

In commenting on the progress of farm electrification, REA Administrator Claude R. Wickard said, "The progress in the 1948 fiscal year was most gratifying, but we cannot afford to slacken our efforts with 1,800,000 farms and perhaps as many other rural establishments still without electricity. These unserved people are as much entitled to electric power as those who already have it. . . "

Leave a good stand of cotton—two to three stalks every 12 to 18 inches in row. Poor stands cut yields.

Stay In The South And Fight, Clement Tells Morehouse Students

Atlanta, Ga.—The old-time point of view that it is possible to live apart nationally or that a nation can stay away from international affairs was discussed at Morehouse College Chapel on Friday by President Rufus E. Clement of Atlanta University, who traced the failure of isolationism to work even as far back as the Middle Ages.

The fact that the world today is small and interdependent has resulted in happenings in Georgia affecting other parts of the world, and what happens elsewhere affecting Georgians, he said.

According to President Clement, there is no point in running away from the state or the country to escape injustices because of race or color or political beliefs. He believes there is a duty to remain in the south to help fake this section an ideal place in which to live. That there is hope of attaining this end and that the outlook is not altogether dark, he cited as signs of progress during the last decade the lifting of voting restrictions in the Democratic primaries, and the recent decision handed down by the Federal Court in Georgia, concerning the equalizing of teachers salaries.

The speaker also called attention to the forward steps toward racial freedom taken at the World Council of Churches in Amsterdam, and the recent statement of the Southern Regional Council, made by a group of Southerners, which was acclaimed in the New York Times as significant as the report of the President's Committee on Civil Rights.

Farmer Improves Land by Use of Heavy Machines

Leslie Pride, a renter of the Mt. Zion Community bought a sixty-acrc tract of land last year. The land was badly in need of improvement when he bought it. Scrubby timber stood on part of it and the entire farm needed terracing.

This year he decided to clear the timber off the land and terracc it. Instead of hiring labor to do the job Pride was advised to hire heavy duty machinery. A good piece of work was done in a short time. The job cost $369 at the rate of $8.50 per hour. Had he used manual labor hc feels that it would have cost him at least $1000. His farm is cleared, drained and terraced and has a good water disposal system. He is now ready to farm.

Negro School in Deep South Wins Rural Beautification Contest

New York, N. Y. — Gallilee School, a simple one-room Negro school near Jackson, Mississippi, has won the National Garden Institute rural school beautification contest. Although a number of schools in the competition made a great improvement in the appearance of their grounds, the transformation in this homely backwoods school was most outstanding. First Prize is a Motorola radio-phonograph combination electricity having been recently installed in the Gallilee School. Second Prize consisting of a aset of the Junior Encyclopedia Britannica gocs to the Pleasant Hill School, Marshall, Illinois. Third Prizc consisting of a large American flag, donated by Sears Roebuck & Co., goes to the Spout Spring School, Spout Spring, Va.

The Alta-Raymond Garden Club and the Forest Hill Junior Garden Club, both white organizations of Jackson, Miss., sponsored thc project. Mrs. J. C. Gladney, President of the Adult organization, reports that in looking for a worthy project to be sponsored by the Junior Club at the Forest Hill School, "we were immediatcly attractcd to a barren building, up at the end of the trail, a two-teacher Negro schoolhouse, Gallilee School. This building, only one huge room, has 59 pupils in the grades of first through sixth. This was one of the most dismal places imaginable, no shrubbery or flowcrs, not evcn a hedge to hide the outdoor toilets.

"After discussing the project, the two clubs decided a more worthy project could not be found. At a time when there was a feeling of racial disturbance,, we felt that to let the boys and girls know that the garden club members wanted to share beauty with them, regardless of color, would do a lot to cement common interest and friendship."

A committee called on the two teachers in the Gallilee School, Ida Jones and Flora Mae Thomas. Both were most enthusiastic, but asked for time to consult the PTA of the schools. Two days later the teachers reported that the PTA had met and were 100 per cent for the idea, and that "the roomful of Negro children had applauded loudly and vigorously."

The club committee met again at the school and a planting plan was discussed. All plants were contributed by members from their own gardens. The junior club furnished flower seeds and bulbs. Then a planting bee was held, the senior garden club providing supervision to the pupils, parents and to the junior garden club members in the proper planting and care of the material used. One crew brought leaf mold from the woods, another dug holes and still another brought water for the plants. It was an inspiring example of cooperation and good will between the two races, as well as the beautification of a spot that had previously been an eyesore. In all, about 53 flowering shrubs and evergreens were planted not including a Japanese privet hedge to hide the outhouses and eight clumps of iris and other perennial plants to make a border in front of the foundation planting.

After the planting was finished, one little Negro boy was heard to say, "Before you all come, the place was all growed up and looked like nobody cared. Now its beautiful!"

Back of this competition, novel in its conception and execution, lies a story Rodney H. Brandon, President of the National Garden Institute, drives back and forth every winter from his home in Batavia, Ill., to his winter home at Lake Worth, Fla. He knows America, having been reared in rural Indiana. The barrenness, ugliness and the sordid surroundings of most country schools depressed him. Why should this be when there is plenty of land and all kinds of native material as well as nursery stock available at small cost, he asked. The very least that could be done would be to plant morning glories over the front of the courthouses that accompany every rural school building. The result was the contest, set up at first on a trial basis, but with the idea of expanding it to cover the entire country, both urban and rural if enough interest was shown. Photographs of the schools were submitted in September, 1947, and another set of photographs were sent in with letters in May 1948. The changes that took place, due to the efforts of teachers. pupils and parents were striking indeed.

Honorable mention prizes consisting of copics of "The Garden Encyclopedia" were awarded to the Victoria School, Butler, Pa.; Greenwood School No. 222, Greenwood, Delaware and the Farmington School, Farmington, Delaware.

Teachers in all the schools and sponsoring garden clubs were awarded honorary certificates by the National Garden Institute.

The judges in the contest were: Mr. E. H. Bakken, Director, Rural Scouting, Boy Scouts of America; Mr. Edgar Guest, People's Poet; Mr. G. L. Noble, Director of the National Committee on Boys and Girls Club Work; Mr. Robert Reed, Editor of the Country Gentleman and Mr. M. L. Wilson, Director of Extension Service, United States Department of Agriculture.

It is planned to continue the competition on a larger and broader scale in 1949. Announcement will be made in September.

Usefulness

Dear Friends: If you want to have friends, if you want to be happy; if you want to possess personal power, make yourself useful. There is no better way.

One of the finest tributes paid Christ was that "He went about doing good." It was a beautiful faith he preached, and the seed sown during His Ministry have sprouted and grown and blossomed for two thousand years. They have spread beauty over wide areas of the world. But we love to think of how He made Himself useful by performing tasks with His hands.

It has ever been a religious principle that help given in love constitutes true greatness.

I know a minister who boasts of getting more sensation out of a congregation than any other minister in town. He uses every means he can and thinks it is smart. He enjoys the reputation of being able to work folks. That man believed he was clever, but he wasn't. The great actors of the world's broad stage, the immortals whose names shine like stars, all took pride in making themselves useful. When a person doesn't ever perform services for the beauty of it; and a love for people, the flowers lie scentless, and thin on his grave, he is forgotten as quickly as a leafless shrub cut down to make room for a bearing applc tree. Let's have thoughts, and kneel often in prayer because nothing is sweeter, it will strengthen your personal power and win friends faster with your hands than with your lips. It is actions that put blooms and fruit on the tree of life. It is actions that strikc the harp cords and produce the loveliest music. Every worthy action sounds a note that cchoes all the way to eternity.

Worthy action is religion right out at the front serving under firc.

The Hon. George Washington never drew his kecn and stainless sword for gold or glory. He rcfused a salary and chose to serve as commander-in-chief of thc colonial forces as a matter of duty towards his country, liberty and God. He was a man of great faith and reverent prayer, hc set a noble example which has only too scldom been emulated Christ made himself useful! That is thc high pinnacle where wisdom worships. When the refreshments ran out at a wedding He replenished the wine.

On another occasion hc provided food for thousands who were hungry. While he came to breathe peace into the world and raise a rainbow of love to assure us against the flood of hate he mct human needs with an open hand. Luke tells of an instance in which he was called to the bed side of Pcter's mother-in-law. He commanded the fever to leave her and when she was restored by his blessed touch, "immediately she arose and ministered." She had learncd a beautiful lesson in Usefulness from the greatest teacher on carth and she commenced helping with her hands. I imagine that woman felt like going out on the highways and shouting to every passer-by how she had been cured by a miraclc. But she decided to serve with her hands rather than with her lips and she commenced looking for somcthing to do

It is a great lesson and I want to impress it upon your minds so indelibly that time cannot efface it.

Usefulness is beauty that never fades; It is wealth that never fails!

Never forgct that! It is better to give your heart over to the sweet and helpful than your lips to the loud and boastful. Pray often, love much, but do, do, do.

"She has done what shc could." That was the eulogy paid so magnificently to a certain woman. Let us win the right to such a trib ute and we may sit on the doorsteps of Heaven and sing with the Seraphs.

A Polish girl was exiled in London expressed the wish one day to help her shackled country. When asked what one so young and inexperienced could do she said: I could give some wounded soldier a drink of water with all the intelligcnce of a grand marshall. That was the spirit of a great warrior in the heart of a little child. God will bless the hand that gives a drink of water to one who is thirsty.

With prayer and usefulness you can reach high enough to sweep aside the smoke that dims your stars.

You use two U's in Usefulness. The first U is in kindly thoughts —that is the You of your mind. The other U is in good deeds. That is the you of your mortal self. Develop both of these "U's" and your life will gain new power.

J. G. Reese.

Press Fight To Enter Oklahoma University

Oklahmoa City, Oct. 7.—Following refusal today of the board of regents of the University of Oklahoma to admit G. W. McLaurin to the graduate school of the University, NAACP lawyers immediately with the three-judge federal court a petition for further relief seeking an order from that court compelling acceptance of Mr. McLaurin prior to October 13 which is the closing date of admissions.

This second rejection of Mr. McLaurin's application on the sole basis of race followed a decision handed down last week by the special three-judge fedcral court invalidating the state's segregation laws insofar as they prevented the admission of qualified Negro students to courses the state offered only at the University. The court, however, refused to issue an injunction compelling admission of the Negro applicant.

When Mr. McLaurin applied today he was informed that no action could be taken to admit him before the next meeting of the board of regents in the second week of November. Meanwhilc the state's attorney general, Mac Q. Williamson, interpreted the court's decision as meaning that the university would either have to admit McLaurin or close its graduate course in education to which he is seeking admission. However, Mr. Williamson held that the regents could delay decision temporarily pending a formal decision by the court which to date has merely handed down an oral opinion.

October Is Red Feather Month

By Henry Ford II
Chairman, Community Chests of America

Beginning in October, Red Feather Campaigns will be conducted by Community Chests in almost a thousand cities and towns to raise an estimated $184,000,000 to finance services essential to the welfare of all the residents of all those communities.

During the campaign period, a million volunteers will call on their neighbors, their fellowworkers, their business associates and ask them to provide the funds necessary to keep all the Red Feather Services of their home communities in operation for a whole year, plus enough for support of the new USO.

The Red Feather is the symbol of many campaigns in one. Nationally, it represents 12,000 voluntary services. Locally, Community Crests may include anywhere from half a dozen separate organizations in small communities, to hundreds in the largest. No national fund is raised. Each community sets its own goal, raises and spends its own money, and gives residents of its community an accounting of its stewardship.

The significant fact is that, in every case, each of these organizations would have to conduct a separate campaign for funds were it not for the once-a-year-united effort under the banner of the Red Feather. By combining the fund-raising appeals of many Red Feather Services into one big campaign each year, the Red Feather conserves time, effort and expense entailed by separate, competitive appeals; protects the contributor from unrelated appeals, and guarantees effective use of funds through annual review of the budget of each Red Feather Service.

The continuing theme of Chest campaigns — "Everybody Benefits, Everybody Gives" — points out this truth: Red Feather Services are not charity or alms to the "underprivileged" but are bread community services to be used and enjoyed by everybody. Relief of actual destitution is now carried chiefly by public agencies, supported by tax funds. The voluntary health and welfare services have an equally great responsibility—to make life fuller, happier, more worth living. Their work is positive and preventive. They help provide nursing and medical care, offer services of child care, family counseling, recreation, informal education, youth leadership, special services to aged and handicapped people. Studies show that users of Red Feather Services are of all ages, races, religious faiths, and economic statures.

Thus, the Red Feather has become a familiar symbol to millions of volunteer workers, givers and beneficiaries from coast to coast. It has become the banner around which all classes, races and religions can rally to provide in their own community the necessary services from which all mutually benefit

Democracy is based upon the conviction that there are extraordinary possibilities in ordinary people.

New Facilities For Recreation Built At Ky. State

Frankfort, Ky., Sept. 22. The new $75,000.00 Outdoor Recreational Area for Kentucky State College is near completion. It will include a combination baseball diamond and football practice field, seven asphalt tennis courts which also serves as a parking lot during football season, and a quarter-mile track with a 220 straight away.

has an abiding respect for the sanity and good judgement of farm people. He regards farmers as the most stable group in America.

A working knowledge of farming and farm problems, reflected in Dapplemere Farm's annual "modest profit," has made Dewey, according to the article, "one of the easiest and most constructive governors to work with that New York farmers have ever had in Albany"

He makes use, too, of his policy of team-work in government with team-work on his farm, which he operates on a joint, partnership basis, with his farm manager, Rolph Lynman.

More Cities Join Fire Prevention Week Program

New York—More people of all racial groups, regardless of race or color, in more cities, towns, and villages will join this year in observing National Fire Prevention Week, October 3-9, than ever before, the National Board of Fire Underwriters announced this week.

One cause of the increased interest in this 37th annual observation is the work done by the President's Conference on Fire Prevention at its meetings last year.

The conference encouraged the selection of Fire Safety Committees in more than 500 cities.

Fire Prevention Week, which will call attention of all citizens to local fire hazards, originated in the Middle West, where more than 40 years ago many communities held an annual "Clean-Up" Day. Various people noticed that this yearly campaign reduced the number of fires, and several towns began referring to the annual event as Fire Prevention Day. Later they settled upon October 9, the anniversary of the great Chicago fire of 1871, as the date.

In 1911, the Fire Marshalls' Association of North America suggested that the 40th Anniversary of the great fire be set aside nationally to alert the American people to the increasing dangers from fire. Twenty-two governors acted upon the suggestion.

In 1920, President Wilson proclaimed October 9 as National Fire Prevention Day. President Harding made the observance a National Fire Prevention Week, and each succeeding President has issued a similar proclamation.

Rep. W. L. Dawson Hails Appointment Of Reform Group

Washington, D. C.—Congressman William L. Dawson of Illinois, Assistant to the Chairman of the Democratic National Committee, today hailed the White House announcement of the appointment of members of the President's Committee on Equality of Treatment and Opportunity in the Armed Services, implementing President Truman's Executive Order to abolish discrimination in the armed forces as another "positive proof of the determination of President Truman to bring full manhood rights to all Americans.

"The presence of two outstanding Negro Americans on this Commiteee is a guarantee that the Committee will carry out vigorously the recommendations contained in the President's Executive Order designed to remove discrimination in the armed forces.

"No two finer representatives of the Negro people could have been selected than Mr. Lester Granger of the National Urban League and Mr. John Sengstacke, publisher of the **Chicago Defender.** Both of these men have demonstrated their integrity to the cause of Negro freedom.

"Indeed, search of the background of each member of this Commtitee reveals a record of true American liberalism."

Gov. Thompson To Do What He Can For Slain Voter

New York, Sept. 23.—M. E. Thompson, outgoing Governor of Georgia, has given assurance of his "willingness to do everything I can, as long as I am Chief Executive, to see that those violating the law of this state are brought to justice."

The Governor's position was expressed in a letter to Thurgood Marshall, NAACP Special Counsel, who had protested the election day slaying of Isaiah Nixon, 28-year-old Negro of Mt. Vernon, who had voted in the recent Georgia Democratic primary despite the threats and warnings of white persons. Two white men, brothers, M. A., and Johnnie Johnson, were arrested and charged with the murder.

It was his understanding, Governor Thompson said in his letter to Mr. Marshall, that the case was "being pushed vigorously by the prosecuting authorities in the judicial circuit where the alleged murder occurred." The slaying grew out of the primary election in which Governor Thompson was defeated for renomination by Herman Talmadge.

Tony White Gets Pan American Award

Veteran Employee Presented With A Gold Pin for Twenty Years' Service

Pan American World Airways—Public Relations Latin America Division Tony White, first Negro employe to complete twenty years with Pan American World Airways, has been awarded a distinctive gold pin for his two decades of service with the intrenational airline.

Born in Clayton, Ala., White joined PAA as a porter August 15, 1928—shortly after operations had begun between Key West, Florida, and Havana, Cuba.

In his job as lead cleaner in the Miami operations department, he had watched Pan American grow from a fledgling airline to a globe-girdling carrier with a 100,000-mile network of routes.

Catholic Students Take Pledge To Back Social Justice

Notre Dame, Inc., Sept. 30.—Special—More than 3,000,000 Catholic students were pledged to service in the fight for social justice for American Negroes at the close of the thirteenth national conference of the Catholic Students Mission Crusade here.

Held at the University of Notre Dame, the four-day conference was attended by 3,600 student delegates representing CSMC units in thousands of American communities. The conference was the largest meeting of its kind ever held in the United States.

Maintaining that "prejudice and unjust practices against Negroes are based fundamentally upon ignorance of the history of this group of Americans and a lack of regard for the Christian ideals which demand recognition of the God-given rights of all human beings," the resolution put the CSMC on record as recommending the continued general study of the history of American Negroes in each area where the CSMC has a unit with the view of helping to remedy unsatisfactory conditions.

Tobias Hails The New USO

New York—Dr. Channing H. Tobias, Director of the Phelps-Stokes Fund, and former official of the old USO, hailed the reactivation of the latter agency and this addition to the Community Chest Red Feather services, in statement to the press this week.

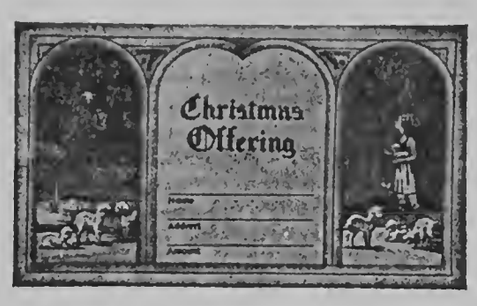
"My official connection with the National War Fund and the USO during the late war convinced me of the indispensable worth of the program of the USO to those who were enlisted in the service of the country," he said.

"It is therefore a source of great satisfaction to me to learn that the USO is to be reactivated to render a similar service to the enlarged defense forces brought about by the recent draft order of Congress."

"It is his sincere hope," he added, "that the public may respond so promptly and generously to the Community Chest appeals, and especially to that phase of it that places emphasis on the needs f the USO."

Christmas Helps

Our Christmas Exercise Edition
of the
CONCERT QUARTERLY
Is one of the most complete programs to be found. Full of beautiful Christmas Day Recitations, Dialogues, Playlets and Songs. Has no equal. 15c per copy—$1.50 per dozen.



Christmas Offering Envelopes
Artistically designed, produced in four colors, good quality of paper.
Size 2½ x 4¼ inches—75c for 100; 250, $1.50; 500, $3.00.

Full from *Cover* to *Cover* of *New Material*

SONGS, RECITATIONS, DIALOGUES FOR CHILDREN OF ALL AGES
Price, 35c per copy

CHRISTMAS BUTTONS
Beautifully lithographed in colors 5c each; 50c per Doz.; 50, $2.00; 100, $3.50.

FOUR PLAYS FOR CHRISTMAS No. 1, A Pearl of Great Price—for 4 girls; No. 2, Silver of the Second Best—for 5 girls; No. 3, The Year's Great Guest—for 7 characters and 7 groups; No. 4, The Star Garden—for 7 characters and 6 groups—All in one binding; price, 35c per copy.
COME ANY TIME—A Christmas Comedy for 7 girls; price, 30c
WORSHIP THE KING—A Sacred Play—13 characters and chorus; price, 30c.
IN SANTA'S WORK SHOP—A play for children—21 characters. The group may be cut if desired; price, 25c.

A CANDLELIGHT PAGEANT—with Familiar Hymns, Dialogues, Pantomime, Processional and Recessional. Price, 35c.

Send all orders to
NATIONAL BAPT. PUBLISHING BD.,
523 2nd Ave., N.. Nashville 3, Tenn.

Paging you teen-agers with pocketbook trouble, not about money matters, but this news will affect that department, too. For few girls in the sub-deb set seem to have as many purses as they would like, and anyone in the know knows that a variety at today's prices would bankrupt the budget.

We have two ways to solve your money bags trouble, however, and with the most wonderful results. Like this.

Lay claim to a one pound coffee can and make a saucy number like the one illustrated. It's easy for all you do is cut two circles of fabric about 26 inches in diameter and dye a dress-matching color. (Make sure you use an all-purpose dye, though, then you won't have to worry about what type of fabric you use because that dye works on all types.) After circles have been dyed and ironed, place tin between two pieces of fabric and stitch outside edges of circle together. Pink raw edges for a combined trim and finish.

Now measure in from edges 4½ to 5 inches and make two circular rows of stitching about ½ inch apart. Insert a drawstring, pull up and shove lining inside. And that's a new purse for you.

The second gay addition to your pocketbook assortment combines a small shallow basket of natural colored straw with a fabric top, dyed to match a favorite ensemble. This one also closes with a drawstring and offers unlimited color changes. Just dye a number of tops, then stitch them in to match the dress of the day.

World-Wide Communion Sunday

O. O. Arnold

Every communion service should be significant for every participant. If the service is without meaning or value for anyone, it had been better if he had not communed. if this sacrament is not a blessing, it becomes a curse. Participation in this holy service should make Jesus Christ and his grace more real to me and more vital and powerful in and through me.

This will not be so just because I take the bread and the wine. The reality of this service is not physical but spiritual. It is not in something I do with my hands and lips, but in something I do with my mind and heart. It is not what we do with the consecrated symbols that counts. but what we do with Jesus Christ.

The Lord's Supper is a ceremony that calls us to think certain things and express certain convictions and make certain decisions. As we do these, we will observe the ceremony in a worthy manner, and it will be meaningful and valuable for us.

Here are some things we should do in this service.

Confess Our Sins. We should come in humility and penitence. This service is most meaningful when we forsake sins and receive God's forgiveness.

Accept and Receive Jesus Christ. In partaking of the bread and the wine, we act out our faith and purpose and surrender by which we receive Jesus Christ and the salvation and peace that he brings. We open our hearts and lives, and let him come in to cleanse and to rule.

Confess Jesus Christ. By taking the bread and the cup, we witness before men that we believe in Jesus as Christ and Lord and Savior and Son of God. This is a service of confession of our Christian faith.

Remember Jesus Christ. The cross has a place on the Communion table. Jesus Christ and his sacrifice for the souls of men should be in our thoughts as we partake of the communion. If we do not remember him, we have failed to observe this sacrament.

Hope in Jesus Christ. In this ceremony we look backward with love, and we look ahead with hope. Believers will do this until he comes in his kingdom. We pray around this table not only, "Forgive us our trespasses," but also, "Thy kingdom come."

Give Ourselves to Christ. This should be a service of dedication in which we give ourselves to Christ. we come to receive that we may go to serve. We say to Christ, "What wilt thou have me to do?"

Forgive and Love Each Other. This is a communion service. We partake together as members of the family of God. As we eat and drink tgether, we express our unity and community in Christ, our communion with each other and with him.

In all these things there is added significance when, with Christians in all countries, we observe this sacrament on World-Wide Communion Sunday. This should not be just another Communion service. What we do in this service is in a new and wonderful setting and relationship. Let us seek to be conscious of the significance of this day.

Let us with this great host of all the world confess our sins. We share in the sins that crucified Jesus and that bring darkness on our world today.

Let us with believers in all lands, through surrender and faith, receive the mercy and the grace of Jesus Christ. Let us allow him to come in and live in us and work through us.

Let us stand reverently with the great multitude as we together gaze on the cross of Jesus Christ. We look on him who was slain for our sins, who died that we might live.

Let us with them give ourselves anew to Jesus Christ that through us his will may be done and his love may be made perfect in service.

Let us join hands and hearts with all persons throughout the world around this common table as brethren in Christ. We are one in him if we are in him. If he is in us, we love one another, and we include all believers in our brotherhood.

The offering we give on World Communion Sunday is an essential part of the Communion service. If we really think together the thoughts to which this service calls us, we will not fail to share with our brethrein in need. We will give gladly and liberally.

The Guiding Voice

Grant Lord, that I may have
The listening ear,
That I may hear
What Thou shalt speak.
Thy voice I seek
To guide my steps aright;
That I may walk in paths of light,
And know Thy presence near.
Lest I should go astray,
O, let me hear
The "still small voice"
That points the way
Of wisdom's choice,
And banishes all fear,
Speak, Lord; out of the silence speak,
And teach my heart to hear.

"The House of the Righteous Shall Stand"

By Mrs. Frances Youngren, Moody Bible Institute, Chicago

Educators, statesmen, and all thinking men and women are agreed that the home is the foundation of all human society, and all our relationships in life have their roots in the home. The destiny and freatness of America lie around the hearthstone.

When God said, "Therefore shall a man leave his father and his mother, and shall cleave unto his wife; and they shall be one flesh," He instituted the first home on earth, and He, Jehovah God Himself, planned, prepared, and visited it. "What therefore God hath joined together, let no man put asunder." Yet the broken home becomes more common and the divorce rates continue to rise. How can destruction be averted and the home made to stand?

"The house of the righteous shall stand," says Solomon. But who are the righteous? The prophet Isaiah says, "But we are all as an unclean thing, and all our righteousness are as filthy rags" (Isa. 64:6). From the pen of the apostle Paul we read, "There is none righteous, no, not one" (Rom. 3:10).

Who are the righteous then? Those who put their trust and faith in Jesus Christ, who is their righteousness. "For he hath made him to be sin of us, who knew no sin: that we might be made the righteousness of God in him (II Cor. 5:21). "But to him that worketh not, but relieveth on him that justifieth the ungodly, his faith is counted for righteousness" (Rom. 4:5).

"The house of the righteous shall stand," says Solomon. Do you and your home fit in this category?

Henry Wallace Is Proud Segregation Rules Were Broken

New York—The "real headline story" of his Southern tour "is that it is possible to do what some said was impossible—to hold unsegregated meetings in every Southern state and to hold them without incident," Henry Wallace told an audience of millions in the first of his Monday night radio reports to the nation.

Wallace is speaking over the NBC network at 10:30 Eastern Daylight Time each Monday night.

Wallace said he found that the "basic human need of the South is simply a reconciling of our daily action with what we are taught in the church and school. The foundation of partriotism and religion is the doctrine of the Fatherhood of God and the Brotherhood of Man.

"The Brotherhood of Man sets forth no limitation of color. The Constitution of the United States sets forth very specifically that the rights of citizens to vote shall not be denied on account of race or color.

"I came out of the South utterly convinced that these denials of God and man are evils which can cost this nation its very life. And I am as thoroughly convinced that these evils can be eliminated without violence, to the greater glory of America."

Wallace charged bluntly that the worst attempts at disruption of his meetings came in mill and steel towns dominated by Northern financiers.

He received friendly receptions in Alabama and Tennessee, he said, because there people "were beginning to appreciate that segregation means wage differentials for Southern labor, means low living standards for Southern people.

"The meaning of segregation can be summed up in the fact that the average annual income in the South is $500 or more below the rest of the country.

"It is this, then—the wage differential and the depressed standard of living—that we challenged on our Southern trip."

Wallace said he came out of the South "with the utter conviction that segregation, racial prejudice and Jim Crow can cost America its life."

USO Recalled To Active Duty, Prepares For Peace-time Task

With Support of Nation's Community Chests, Famous War-Time Friend of Service Man Will Serve New Armed Forces

New York—Recalled to duty within less than a year following its honorable discharge with a notable record for outstanding war-time service to men of all races, the USO is now being reactivated and will march along shoulder to shoulder with the young man of the new peace-time Armed Forces.

Again with the support of the nation's Community Chest, the USO will render to the personnel of the new military establishment the same friendly services for comfort, recreation and morale which distinguished its career during World War II, when it was universally regarded as the service men's "home away from home."

In requesting and approving the reorganization of the USO to provide the needs of the greatly expanding peace-time forces, Defense Secretary Forrestal said. "The USO will serve a vital present need. It also will serve as a public reminder that even in these difficult days the development of our defense plans will be purued in accordance with traditional American policies."

Whereas, during the peak of its war-time activities the USO canducted 3,035 operations, exclusive of Camp Shows, its new assignment contemplates activities which will be geared to the developing needs and the gradual expansion of the armed services. At present the six national agencies that formed the original USO are conducting 105 operations in 65 cities with the funds remaining after the liquidation of the old USO. These include 62 clubs for service personnel, 13 standard service units of the Travelers' Aid, 3 lounges where military travel is heaviest, and 23 agency offices specializing in information and referral services. There are also 2 operations in Alaska and funds for 2 operations in Guam.

It is expected that these operations will be continued in 1949 at substantially the same level. The navy will probably require only some expansion of present facilities, while the Army and Air Forces together will re-establish and reopen in 1949 some 50 camps requiring substantial club services.

The National Budget Committee, jointly sponsored by the Community Chests and Councils and the National Social Service Assembly, has approved a budget of $6.650,000 to finance USO operations in 1949. Assets of $2,000,000 acquired from the liquidation of the war-time USO have been made available toward the total budget, leaving $4,-650,000 as the national campaign goal. This amount will be raised principally through the inclusion of USO Community Chest Red Feather campaigns.

Utilization of this instrumentality will obviate the necessity of individual fund-raising campaigns on behalf of the USO in cities where it is included in the Community Chest and will enable the public to support the new USO through the single once-a-year federated campaigns of the Community Chests.

In addition to providing the customary health, welfare and recareational services, the USO is currently financing Veterans Hospital Camp Shows, the pecaetime successor to the war-time USO Camp Shows, which is serving the veteran in 107 hospitals of the Veterans Administration and the Army nad Navy. It is expected that USO funds will continue to be used to finance the Veterans Hospital Camp Shows.

A Morning Prayer

By Beulah France

Now I wake and see the light,
God has kept me through the night;
So to him I kneel and pray,
"Father, keep me thraugh this day."

Grow enough, can enough, store enough.

Youth Week Awards To Be Made Again

Mr. Lemuel Peterson, Director of Public Relations, Gives This Assurance

Work Sponsored by the International Council of Religious Education, With Headquarters in Chicago

Chicago—College and summer conference scholarship awards will be made again in 1949 through the United Christian Youth Movement, it was announced by Rev. Dennis Savage, Director of Youth Council Services.

The awards will be a major feature of the celebration of National Youth Week, Jan., 30, Feb., 6, 1949.

National college scholarships of $400 a year for four years and scholarships each year to a U. C. Y. M. summer conference will be made to the highest ranking boy and girl.

Regional college scholarships of $250 a year for four years and summer conference scholarships will be made to the highest scoring boy or girl in each of six regions of United States and Canada.

The young person rating second in each region will receive a scholarship to the conference in his area. Partial scholarships to summer conferences will be granted to the three next highest contestants in each of the six regions.

Participants must be Christian youth between 16 and 24 years who are at least in their last year of high school and not more than their first year of college.

The Parshad Youth Week Award follows:

1. Evidence of Christian service in the local church and in interdenominational activities.

2. Evidence of successful Christian citizenship in school, work, and community.

3. Preparation of a 1,500 word essay on "Youth in the Community or Christian Responsibility."

Entries in local churches will be judged by January 24, 1949. A series of judgings in the community, state or province, region, and in the nation will be held before the winners will be announced next spring.

"Purpose of the award, in addition to providing educational training for Christian youth, is to center the thinking of young people upon the implicatoins of the Christian Gospel and to stimulate them to greater activity in winning of their communities for Christ," stated Mr. Savage.

Further information may be secured for denominational offices, state or city councils of churches, or the UCYM, 203 N. Wabash Ave., Chicago 1, Ill.

NAACP Bunk About 80th Congress Is Feature Of Bulletin

New York, Sept. 23.—The voting record of members of both houses of Congress on civil rights and other issues is published in the current issue of The NAACP **Bulletin**, the Association's bimonthly organ. The record reveals the vote on seven vital issues in the House of Representatives and on nine in the Senate.

"The record of the 80th Congress," the report asserts, "is a dismal record of failure. Failure to control inflation; failure to provide adequate housing; failure to meet the educational and health needs of the people; failure to enact a single civil rights measure You are urged to review the record of each of your senators and your representatives. On November 2, remember those who have voted for your interests and those who have voted against you, regardless of party affiliation."

WOMAN'S PAGE

MAIN DISH SOUP

3 or 4 pounds meaty soup bones (beef or veal)
Drippings or other fat
Bay leaf, if desired
3 cups diced vegetables
Salt and pepper

Have bones cracked and remove small slivers. Brown in fat in a large kettle. Cover with water, add bay leaf, and simmer until meat is tender enough to full from bones—3 to 4 hours.

Add vegetables, such as onions, carrots, and potatoes during the last half hour of cooking.

Remove bones from broth and skim off fat. Cut up meat and add to the soup. Season to taste.

To Complete the Meal

Serve with green salad and fruit pie. If there isn't much meat, add cottage cheese to salad or serve these with pieces

For Variety

Onion Soup: Omit other vegetables. Slice 4 medium-sized onions, brown in drippings before adding Serve piping hot, topped with toasted bread sprinkled with grated cheese—the traditional French way of serving.

Beet Soup: To 1 quart broth and meat add two large beets, grated or ground, one cup chopped cabbage, and two chopped onions. Simmer until vegetables are tender. Season with salt and pepper. Top each serving with sour cream.

BROWN BEEF STEW

1 pound boneless stewing beef
Salt and pepper
Flour
Drippings
1 1-2 cups water
3 potatoes, diced
2 onions, sliced
3 carrots, diced
1 cup green beans

Cut meat into cubes. Sprinkle with salt and pepper, roll in flour and brown in drippings.

Add water, cover, and simmer until almost tender—2 to 3 hours.

Add vegetables, season with salt and pepper, and continue to simmer, covered until vegetables are done. Stir occasionally.

To Complete the Meal

Serve with coleslaw or green salad and a baked pear or peach for dessert.

For Variety

Green-Tomato Stew—Use 1-2 chopped onion in place of sliced ones. Brown with the meat. Use 2 medium-sized green tomatoes, quartered, instead of green beans.

Lamb or Veal Stew—Use breast or neck of lamb or veal in place of beef and 1-2 cup diced turnips instead of green beans.

Quick Stew with Hamburger.—Use hamburger in place of stewing meat. Brown the meat, add vegetables and water and simmer. The stew will be done in half an hour or less.

SWEET-sour spareribs, Chinese style

2 pounds spareribs
1 1-2 cups water
1-4 cup raisins
1-2 teaspoon salt
2 green peppers, cut in 6 pieces each
1 1-2 tablespoons cornstarch
1-4 cup sugar
1-4 cup vinegar
Soy sauce

Cut spareribs into serving portions and brown in a frying pan over moderate heat—about 5 minutes on each side.

Add 1 1-2 cup of water, the raisins, and salt.

Cover pan tightly and cook over very low heat 20 minutes.

Add green peppers, Stir in corn starch blended with sugar, vinegar and one cup of water.

Cover and continue cooking over low heat for 30 minutes. Stir occasionally and add more water as needed to prevent drying. Before serving add soy sauce to taste.

To Complete the Meal

Serve with rice or hominy grits and a green salad. Baked pears would make a good dessert.

Spareribs in Another Way

Baked Spareribs.—Bake spareribs in a moderate oven (325 degrees F.) until the meat is tender, about 1 1-2 hours. Baste several times with a barbecue sauce, if desired.

PORK SHOULDER WITH SAVORY STUFFING

Skin a 5 to 6 pound fresh pork shoulder and remove bones.

Sprinkle meat on inside with salt and pepper, and pile in some of the stuffing. Begin to sew edges of shoulder together to form pocket and gradually work in the rest of the stuffing. Do not pack tightly.

Sprinkle outside of shoulder with salt and pepper, and if desired with flour also.

Place the roast, fat side up on a rack in a shallow uncovered pan. Roast without water, in a moderate oven (325 degrees F.) until tender—about 4 hours for a 5-lb. shoulder.

Turn roast occasionally. Remove strings before serving.

Serve with sweetpotatoes, fried apples, celery salad, and raisin pie.

Savory Stuffing

1-4 diced celery and leaves
1 tablespoon diced onion
1 tablespoon chopped parsley
2 tablespoons fat
2 cups soft bread crumbs
1-4 teaspoon savory seasoning
Salt and pepper

Cook celery, onion, and parsley in fat for a few minutes.

Add bread crumbs and seasonings and stir until well mixed. This stuffing may be used with other meats and with poultry. Sausage, chopped tart apples, or chopped nut meats may be added.

SWISS STEAK

1 pound beef or veal rump or round cut about 1 inch thick
Salt and pepper
Flour
Fat
2 cups cooked or canned tomatoes or tomato juice

Season meat with salt and pepper, sprinkle with flour. Pounding helps make the meat tender.

Cut meat into serving pieces and brown in fat.

Add tomatoes or juice, cover and simmer gently until meat is tender—about 2 to 2 1-2 hours.

To Complete the Meal

Serve with mashed potatoes corn, lettuce salad and prune whip

For Variety

Swiss Steak with Brown Gravy.—Use water instead of tomatoes. When done, remove meat, add water if needed to make 1 cup total liquid, and if necessary thicken with flour blend with cold water.

Swiss Steak, Onion Gravy.—Add 2 cups sliced onions to Swiss Steak with Brown Gravy during the last half hour of cooking.

Spanish Steak—Follow recipe for Swiss Steak. using 3-4 pound meat. Brown 1-2 cup chopped onion and 1 chopped green pepper in fat. Cook 1 cup macaroni in boiling salted water. Mix macaroni in boiling salted water. Mix macaroni, onions, and pepper with tomato sauce and serve over meat

SAUSAGE WITH SWEET POTATO AND APPLE

1-2 pound sausage
2 medium-sized sweetpotatoes
3 medium-sized apples
1-2 teaspoon salt
1 tablespoon flour
2 tablespoons sugar
1-2 cup cold water
1 tablespoon sausage drippings

Cut link sausage into 1-2-inch pieces. Fry until well done. If bulk sausage is used, shape it into small balls before frying or break it up as it cooks.

Pare and slice potatoes and apples.

Mix salt, flour and sugar together and blend with cold water.

Arrange layers of potatoes, apples, and sausage in a baking dish, pouring some of the flour and sugar mixture over each layer. Top the dish with apples and sausage, and add drippings.

Cover; bake in moderately hot over (375 degrees F.) until apples and potatoes are tender—about 45 minutes.

To Complete the Meal

Serve with crisp green salad. For dessert have a well-chilled creamy rice pudding made with eggs and milk to supplement the protein from the small serving of meat.

For Variety

Thin slices of smoked shoulder or shoulder pork chops sliced thin and well browned, may replace the sausage.

WEINER-TOPPED SPAGHETTI

8 weiners
1 tbsp. salt
3 qts. boiling water
4 oz. spaghetti
3 tbsp. drippings
3 tbsp. enriched flour
2 1-2 cups canned tomatoes
1 tsp. salt
1-2 tsp. sugar
1 tsp. vinegar
1 tsp. Worcestershire sauce
1 cup green beans
1 cup canned green beans
4 onions sliced, about 1-2 inch thick

Heat weiners in water. Add one tablespoon salt to three quarts boiling water. Gradually add spaghetti and cook until tender, (about 12 minutes). Drain and rinse While spaghetti is cooking, combine drippings and flour. Stir well. Add tomatoes. Cook until thickened. Add salt, sugar, vinegar, Worcestershire sauce and the green beans. Blend well. Fold in spaghetti. Pour spaghetti mixture into greased casserole. Alternate weiners and onion slices in circle on top of casserole. Bake in moderate oven (350 degrees F.) 30 minutes. Yield: four servings.

POTATO SALAD

2 cups boiled potatoes
1 onion, mineed
3 hardboiled eggs
Cooked dressing

Chop onion fine, cut potatoes in cubes, cut yolks and whites of eggs in small pieces or rings. Mix with cooked dressing and season. One-half pound crisp bacon makes a nice addition. Serves six.

PICNIC POTATO SALAD

1-2 peck boiled potatotes
3 medium sized onions
1 green pepper
2 tomatoes
6 slices breakfast bacon
1 tbsp celery seed
1 cucumber

Cut potatoes in cubes; chop fine onions, green pepper, and cucumber. Fry bacon very dry and crush fine. Place in bowl of potatoes, green pepper, onion, cucumber and celery seed; add bacon and toss lightly together. Mix with dressing which is made as follows:

Bacon drippings
1 tbsp vinegar
juice of 1 lemon
2 tbsp. chopped mustard pickle
3 tbsp oil
1 tbsp. Worcestershire sauce
Salt, pepper and paprika

Mix dressing thoroughly with the other ingredients and serve on lettuce. Garnish with the sliced tomatoes. Serves 12 ta 14.

PECAN TARTS

1-2 cup sugar
2 tbsp. butter
3 eggs
1 tbsp. flour
1-4 tsp. salt
1 tsp. Almond extract
1 cup white syrup
1 cup pecans (lightly toasted)

Cream butter and sugar, add beaten eggs, flour, salt, extract, and syrup. Stir well. Add pecan meats. pour in individual shells, sprinkle with broken pecan meats and bake one-half hour in a moderate oven.

PIE PASTRY

1 cup flour
3 tbsp fat
1-2 tsp. salt
1 tsp. sugar

Sift flour, salt and sugar. Cut in shortening with knife. Mix lightly with ice water. Fold and chill.

CHERRY PIE

1 qt. cherries
1 1-2 cups sugar

Cover cherries with water after they are stoned; add sugar; cook until tender. Line pan with pastry; strain cherries and fill pastry; sprinkle with a little sugar; add butter in small pieces and a few tablespoons of cherry juice. Strip with pastry. Bake in 375-degree oven 35 to 40 minutes.

Frozen pork will be fine in flavor if used within five to six months of the date stored, advises the U. S. Department of Agriculture.

ASPARAGUS CARE

Asparagus, although a highly perishable vegetable, lends itself to many dishes and menus. Its flavor changes rapidly after picking. If necessary to keep for a day or overnight after purchasing, untie the bunch, trim ends and rinse in water. Dry thoroughly. Put in covered dish or wrap in wax paper and place in refrigerator. Never put asparagus away wet s it becomes slimy and decays easily.

Dividing and replanting iris plants in August improves the display of blooms in the following year.

If only one-half of a head of cabbage is used for slaw or some other dish the remaining head should be wrapped in waxed paper and stored in the refrigerator.

CUSTARD PIE DE LUXE

When making custard pie—after it's baked and cool—spread whipped jelly over the top. Then add meringue and brown lightly in the over. You'll be amazed at the delicious flavor so little jelly adds.

HOUSEHOLD HINTS

To renew the elastic in a garment: (1) Pin the end of the new elastic to the worn elastic and pull it in. (2) Pull the old elastic out at the same time. This makes the job simple and quick.

Grow some garnish greens such as parsley, chives and endives in your kitchen window boxes. You can "dress up" your everyday foods with these garnishes and make your meals look more tempting.

ENDS FRYING ODORSS

When you fry fish, onions, and other strong-smelling foods, you are bound to have unpleasant odors through the house. You can lessen such odors if you will pour off excess grease from the pan immediately after food is fried, then sprinkle the pan with baking soda. The smell will be ehecked, and whether you decide to clean the pan then or return to it several hours later, you will find the grease readily removed with a few swishes of a paper towel.

Homemade chutney can be easily concocted from apples, onions, brown sugar, cider vinegar, raisins and spices.

MARGUERITES

For quick cookies try making marguerites. Beat an egg white until stiff but not dry; add three tablespoons sugar gradually, beating as you do. Then mix in a few grains of salt, a half-teaspoon of vanilla and three or four tablespoons of finely chopped pecan nutmeats. Spread this mixture mounding it, on about a dozen salted crackers. Place on a baking sheet and bake in a slow oven for about 15 minutes.

Marmalade served in an orange shell is a pleasant breakfast eye-opener.

BAKING HINT

When custard is being baked the custard cups should be placed in a pan of water; this helps to maintain an even temperature thru out the whole custard. If the water in the pan boils, the temperature is too high and will cause curdling.

Alkaline stains may be removed from aluminum saucepans by cooking acid fruits such as rhubarb or tomatoes in them or by boiling a solution of vinegar and water in the pan for 5 to 8 minutes.. One tablespoon of vinegar for every quart of water should be used.

GARDENING NOTES

All cucumbers will climb if they are permitted to do so. In a small vegetable plot cucumbers, tomatoes, peas, beans and melons can be grown on the fence.

In cooking, one-half cup of tomato paste plus one-half cup of water can equal one cup of strained tomatocs.

SLIPCOVER BED PILLOWS FOR DAYTIME USE

Storage is generally a problem in the small apartment. Many apartment-dwellers who use dual-purpose sleeping equipment—mattresses and springs-on-legs, sofa beds and studio couches—often find storage of bedclothes and pillows a nuisance.

One good answer to this problem is to slipcover the pillows attratcively and use them on the lounge during the day—at night they are quickly made ready for sleeping. Easily made of cretonne, chintz, or other material to match or contrast with upholstery and draperies. these covers can be closed with zipper fastenings. Whether tailored in style or made with ruffles. they add a colorful note of interest and comfort to the room, as well as proving most convenient..

Since the pillows will be in more constant use, they should be frequently checked for signs of wear. When they become limp and are no longer boyant and resilient, they cannot serve their main purpose of supplying support to the head and neck muscles during sleep.

NEW PRODUCT PREVENTS FRUIT DISCOLORATION

A recent development in the food field—a special mixture of ascorbic acid, citric acid and milk sugar—should prove a real aid to the housewife in the preparation of fruits for home freeing or use on the table. This scientifically formulated product is designed to retain the natural fresh color and flavor of all fruits subject to discoloration.

A teaspoon of the powder mixed with an ounce of water gives a solution of the same citric acid concentration and seven times the ascorbic acid (vitamin C) strength of whole lemon juice. It may be used in many places in the home where lemon juice is employed, such as fortifying fruit drinks, salads, beverage and other instances where it can furnish an appreciable qupality of the required vitamin C in the diet.

THE MODERN FARMER

VOL. XXI. NASHVILLE, TENN., OCTOBER 15, 1948 No. 9

Higher Corn Yield Is Farmers Goal

Membership In 100 Bushel Corn Club Yearly

Membership in 100 Bushel Corn Club Yearly

By C. W. Foster, Negro County Agent

Wilson, N. C.—In 1944, there were 39,320 acres of corn grown in Wilson County but the average yield was only 20 bushels per acre. The average yield of tobacco per acre that same year was 1,021 pounds. It was quite obvious that growers who produced more than a thousand pounds of tobacco on an acre of land could so produce more than 20 bushels of corn on a similar plot of land. Therefore, the writer, along with other county agricultural workers, launched a program whereby the average yield of corn per acre might be doubled within the next ten years.

It was about this time that the North Carolina Experiment Station Seed Producers and other interested agencies were laboring diligently to offer the state's corn growers high yielding hybrid corn seed which would be adaptable to the various geographical sections of our state. Gradually such seed became available. With their availability came the timely advice of the Five Steps to Increased Corn Yields.

1. Use of adapted hybrid seed
2. Select fertilizer to fit soil conditions and past cropping history —200 to 500 lbs, 4-8-8 or 6-8-6 on a well-prepared seed bed
3. Provide adequate stands by planting seed of high germination and planting them in 3 1-2 feet rows and 15-20 inches in the drill.
4. Cultivate shallow until the corn is 2 1-2 feet high then cease culivation
5. Sidedress at 6-8 weeks using 2 lbs. of nitrogen per acre for every bushel of corn desired.

Early last year, a group of corn producers, young and old, let it be known that they were interested in competing with each other in order to ascertain who would produce the greatest number of bushels of corn per acre. The result of their efforts are as follows: (adult) Frank Thompson, Rt. 1 Sims 83.2 bushels NC 26; Benjamin Pettiford, Rt. 2 Wilson, 83.1 bushels NC T 20; and Henry Stevens, Rt. 2 Wilson, 80 bushels NC T 20. In the 4-H Club division, R. T. Pettiford, Rt. 2 Wilson led with 97.1 bushels of NC 26; Milton Artis, Rt. 1 Sims, 80.8 bushels, N. C. T. 20; J. Arthur Batts, Rt. 3, Elm City 797 bushels, NC T. 20; and John Estees Parker, Elm City Rt. 1.79.3 bushels, NC T 20. Each of these growers is an associate member of the North Carolina 100 Bushel Corn Club. (Members of the 100 bushel Corn Club must produce 100 or more bushels of corn per acre; associate members 75 to 100 bushels.) They have been awarded certificates and pins for their achieve ment in the 1947 contest. Milton Artis attended the 100 Bushel Corn Club conference held at A. and T. College last January. He was third place winner in a junior speaking contest held during the

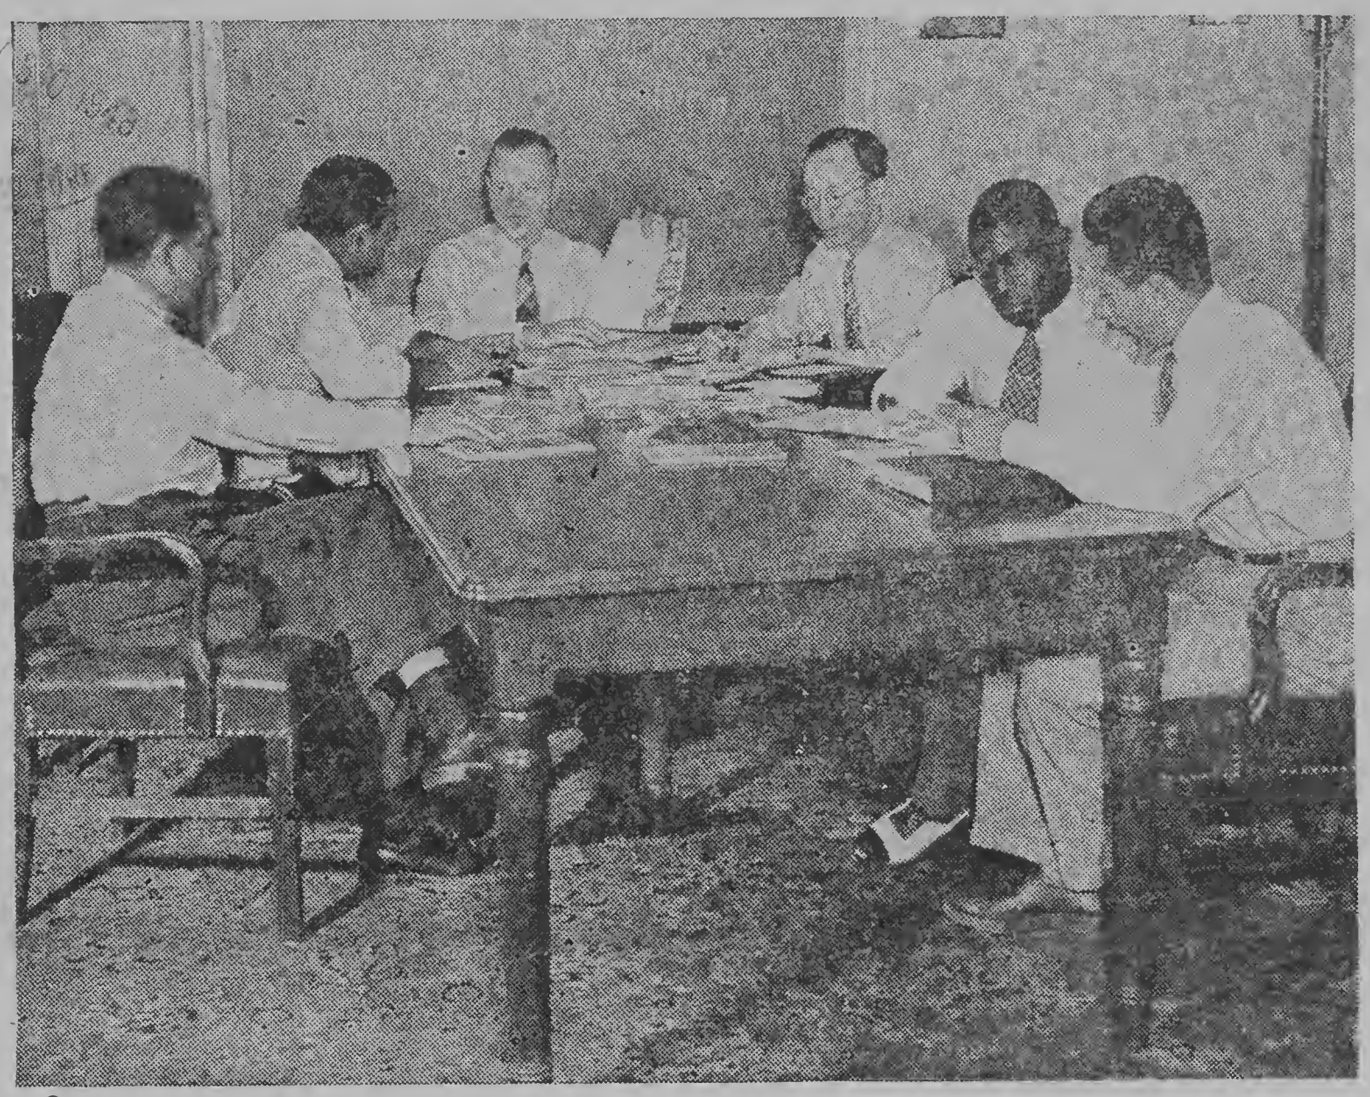
Haitian Among Twelve Foreign Trainees Studying Here

Haitian Among Neighbors Studying USDA Here



Five of the twelve professional workers from foreign countries who are here studying Extension Service methods of the U. S. Department of Agriculture are shown taking part in a classroom discussion on the use of publications. Left to right are: F. A. Sierra Soto of Columbia, Honorato de Freitas of Brazil, Henry Milsham, publicatons specialist of Extension Service, Tain Ching Chu of China, Montasse D. Charlot of Haiti, and Pedro Aulestia of Ecuador. Charlot will make field studies in North Carolina and Alabama.

Montasse D. Charlot District Agent In Haiti Studying Agriculture Methods

Haitian Among 12 Foreign Train ees Studying Agricultural Extension Here:

Montasse D. Charlot, district agricultural agent in Haiti, is one of 12 foreign professional workers who were here studying the agricultural extension methods of the U. S. Department of Agriculture.

"I am seeking information that will help my people improve their methods of growing, harvesting, and preparing products for market," says Mr. Charlot, who plans to remain here a full year, receiving instruction and practical field experience in better farming practices.

Other countries represented among the student group here are Brazil, Chile, China, Columbia, Ecuador, Nicaragua, Panama, Peru and Uruguay. After their orientation courses in the Washington office of the Department, the students will be sent to various States to gain ractical field exerience.

Mr. Charlot will spend several months with Extensive Service personnel in North Carolina and Alabama. He left for North Carolina recently. Upon returning to Washington later he will prepare a report on his field work and attend summary courses taught by members of the Extension staff to help him and the other students adapt what they have learned to the solution of agricultural problems in their own countries.

This project, which is part of the State Department's exchange of students program, is under the gen eral direction of Dr. Gladys Gallup of the Extension Service division of field studies and training, with Dr. Fred P. Fruachey in charge of the activity. Since its inauguration three years ago, 26 foreign students have come to the United States to study extension

Farm Wages Hit New High ------14

New Technique In Weeding Is Being Used Extensively In Many States

Chicago, Ill.—Today's modern method of killing weeds with low flying, high speed airplanes utilizing a "selective chemical killer" is being hailed by farmers and cattle raisers throughout the country.

Farmers of the great wheat belt have found a solution to their most difficult problem weed growth by the new technique of rapid economical spraying from the air.

Since April of this year thousands of acres of spring wheat in Oklahoma, Texas, Kansas, Nebraska, Colorado and neighboring states have been successfully treated. Thus far, estimated savings to farm operators total many thousands of dollars as a result of increased yields and beter quality crops.

The airborne technique as a specialized commercial operation has been engineer-perfected by Martin-Senour Company, Chicago, manufacturers of Agricultural Weed-No-More a 2, 4-D ester formula. The liquid-chemical compound, mixed with refined petroleum oils of a controlled specific gravity, is sprayed from converted Stearman biplanes travelling near 100 miles per hour in crosswinds

Booker T. Washington Memorial Week To Be Observed

Only Living Child Of Noted Educator Will Be Present

Booker Washington Birthplace, Virginia—The Third Annual Booker T. Washington Memorial Week will be observed November 14-20, 1948. The theme will be "Tolerance and Goodwill." S. J. Phillips, President of the Booker T. Washington Birthplace Memorial announces that a featured attraction of the week will be a radio presentation of "THE BURNING BUSH," Monday, November 15, at 8:00 p. m., EST, on the Cavalcade of America, sponsored by the DuPont Company. This will be a dramatic presentation of Booker T. Washington's rise from slave cabin to Hall of Fame. The DuPont Company is using an all-star Negro cast with Juano Hernandez in the leading role as Booker T. Washington. Mrs. Portia Washington Pittman, only living child of the noted Educator, will be an honored guest. In this connection Mrs. Pittman states although her father has been dead thirty-three years, his program of Industrial ing is still making a large contribution to the American way of life.

Other features of the week will include broadsast tie-ins with outstanding network programs; a presentation of "From Slave Cabin to Hall of Fame" by a cast of 500 in Roanoke, Virginia, and school and church programs over the Nation. According to Mr. Phillips, these annual observances of Booker T. Washington Memorial Week have helped to focus the attention of the nation on the life and achievements of Booker T. Washington to the extent that there is now a strong national appreciation for the establishment of a Memorial at the birthplace of Booker T. Washington in Franklin County, Virginia.

Since the observance of Booker T. Washington Memorial Week last year, a number of national figures have been added to the Board of Governors and the Trustees of the Memorial; a post office has been functioning nearly a year and has advanced from a Fourth Class post office to a Second Class one; a replica of the cabin in which Booker T. Washington was born has been built by the Commonwealth of Virginia; a 30 acre orchard has been planted, an excellent agricultural program set up, and construction is now going on for a building which will be used in Trade Training for Negroes below high school level. Hundreds of visitors from all parts of the country have seen and commended these achievements.

At Roanoke, Virginia, 16 miles from the Birthplace, a Field Service Activity under the name of "The Booker T. Washington Memorial Trade School" has been established. An attractive 12-room building has been purchased and fitted out to serve as headquarters and to house classes in Business, Sewing and Applied Home Economics, including courses in Domestic and Service Occupations. Another building with 50,000 feet of floor space houses shops and facilities for teaching Bricklaying, Carpentry, Painting, Shoe and Radio Repair, Auto Mechanics, Trade Mathematics and Mechanical Drawing. Both day and evening courses are offered. 140 Adults have registered to date. All seem eager to take advantage of the opportunities that have been made possible to them.

S. J. Phillips states that this program has been made possible largely through the sale of the Booker T. Washington Memorial half dollar. On the strength of the good that has already been achieved, the Booker T. Washington Birthplace Memorial is calling on the Nation to purchase 2,000,000 Booker T. Washington Memorial half dollars at $1.00 each during this Third Annual Booker T. Washington Memorial Week. Ours is a great land. It will remain so in proportion to the extent that every American is given the opportunity to develop to his fullest capacity. The program of the Booker T. Washington Birthplace Memorial centers around the needs of Negroes below high school level. These include more than 85 per cent of the Nation's 14,000,000 Negroes.

NAACP Seeks Court Ruling To Band Oklahoma Jim Crow

Oklahoma City, Oct. 28—Vigorously continuing its fight for equalization of educational opportunity and ultimate breakdown of Oklahoma segregation laws, the National Association for the Advancement of Colored People this week sought a court injunction ending segregation of G. W. McLaurin from white students at the University of Oklahoma.

Admitted to the graduate school of the university after a three-judge federal court ruled that the state's segregation laws were unconstitutional and unenforceable insofar as they prevented him from obtaining the education he desired, McLaurin has been segregated in every way since he began his studies on Oct. 13. He sits in a small anteroom adjoining the regular classroom; studies at a separate table in a corner on the top floor of the library: and is assigned a separate eating place.

In filing a petition seeking to have the court prohibit segregation of McLaurin, NAACP Special Counsel Thurgood Marshall made clear, at a federal court hearing on Monday, that an attack was being made on segregation as such and that the segregation of this student denied him the equal protection of the laws guaranteed by the Constitution of the United States.

Marshall also asserted that the federal court decision was broad enough to include others who seek admisson to the graduate school, and asked the court to include in this case the lawsuit of Mrs. Mauderie Hancock Wilson, another Negro seeking admisson to Oklahoma University. State's Attorney General Mac Q. Williamson had ruled that the university need not admit Mrs. Wilson under terms of the McLaurin decision.

Also in Oklahoma City, the officers of the Oklahoma State Conference of NAACP branches met last week, reaffirming their opposition to segregation in any form in public educatiton, and unanimously voting their full support to the fight to break these barriers down.

Here's Good Recipe for Jam Cake

By Mrs. Aubrey L. Hinton, Adolphus, Ky.

If you want to make a jam cake by a recipe that has proven itself to be dependable for at least 40 years, try this one:

JAM CAKE

One cup jam
One-half cup sour milk
Two and one-half cups flour
Whites of two eggs
One cup sugar
One-half cup butter or lard
yolks of three eggs
One teaspoon soda
One teaspoon each: nutmeg and cinnamon

Beat the white of one egg to a stiff froth, add one heaping teaspoon sugar, beat together, then spread between layers of cake. Sprinkle with raisins if you wish.

Low-Grade Cotton Used as Insulator

Houses may be "wrapped in cotton" to keep out the cold. The U. S. Department of Agriculture is sponsoring a program to encourage the use of low-grade short staple cotton in the manufacture of insulation for homes.

The program is a part of USDA's efforts to help farmers develop markets for low-grade cotton.

Farmers' 'Gravy Train' Just Decent Return in Economic Cycle

By John Lipscomb

All farmers aren't getting rich these days because of high food prices—they're just earning a decent living for the first time in about 100 years.

Being the underdog for a century is not an enjoyable experience, as even the rankest Republican ought to admit.

And if you're inclined to doubt that business about the 100 years, stick your nose in a desk full of statistics up around the U. S. Department of Agriculture and the Department of Commerce. Maybe we can't pin it down to an even hundred, but it's uncomfortably close.

In all those years, without exception where official figures are available, the cash income of this nation's farmers has been far, far below the average cash income of those who were not farmers.

Farmers Less Dependent

Back in the old days farmers were less dependent on other working groups than now. But today's farmer is not the independent, self-sufficient fellow that the anti-farm politicians would have you believe. He needs cash and needs it badly. For the first time in many years, he's getting it.

Since 1939, prices on his products have jumped 83 per cent, but don't let the figure fool you. That 83 per cent increase is figured BEFORE his taxes and living costs are deducted.

Also, his prices were touching bottom when the boom began to build him up.

Most folks don't know, or even consider, how big a portion of the U. S. citizenry is made up of farmers. They constitute about one-fifth of the nation's population.

Even today, with prices as high as they are, the average net income of the American farmer is only 46 per cent of the net income for those not engaged in farming. Not many folks become millionaires under such a condition.

Makes No Laws

Recently a Virginia Senator, A. Willis Robertson, had a little session with the U. S. Bureau of Agricultural Economics. The bureau makes no laws and rarely offers an opinion on anything. It sits and figures and figures and usually comes up with the facts. Here are some of them:

Right now the United States is consuming 12 per cent more food than it did in 1939.

The quality of food is better.

Our population will continue to increase and of course even more food will be demanded.

Here are some more facts that can be added to those above, and when you get halfway through them you'll begin to see the answer:

The nation's farms are not, as a whole, in tip-top shape.

It is estimated that fully one-third of all farm top-soil has been destroyed, either by misuse or by erosion. An average of six inches of top soil is left.

Farmers must have money, cold hard cash, if improvements are to be made.

So— it doesn't seem likely that the prices on farm products are going to drop very much, does it?

Experts Hesitant

Government experts are hesitant about making any flat predictions for 1949, but they agree unofficially that food prices probably will be about the same as they have been this year— without showing any spectacular rise or fall.

Any action that Congress may take next January will, of course, have some effect but that effect is not likely to be much more than noticeable to the housewives of the land.

Prayer

It is no loss of time to pray. Many think it chiefly or wholly lost time. They are so full of business, they say, and assume that prayer will spoil their business. I tell you that your business, if it be of such sort as ought to be done at all, will go all the better for much prayer.

Are you studying? It is no loss of time to pray, as I know very well by my own experience. If I am to preach, with only two hours for preparation, I give one hour to prayer.—Charles F. Finney.

CHOICE WORSHIP SERVICES AND PLAYS

A book that fits in with the urgent needs of the present day. Written by various authors familiar with church requirements. Among its contents are several choralogues: The Woman at the Well; The Nativity; The Prodigal Son; etc. Tribute to the Rural Church is a beautiful tableau. The Little Church of Childhood is a plea for the continuance of the rural church. The Melting Pot is a patriotic number climaxing with the church's contribution to the country. Others are for Lord's Day observance and general occasions. A valuable book. 40c.

PLANS AND PROGRAM BOOK

Here is a collection that will provide an abundance of program material to those entrusted with the responsibility of preparing suitable programs for socials, Sunday School entertainment, Young People's Societies, etc. It is a book for many occasions and contains 142 pages

Price 60c per copy

OUR NEWEST AND MOST POPULAR SONG BOOK

The Church And Laymen

Gov. Luther Youngdahl, Abstract From His Message

Christian Youth's Conference Of North America Heard Brilliant Address

Christianity is desperately in need of lay members who will give more than half loyalty, secret discipleship and lukewarm fealty, surreptitious lip service. There are too many laymen who hope to gain heaven without losing hold on earth

Now I say to you with desperate sincerity that the Christian Church represents the one great moral hope of society today. Clearly the lines are being drawn for a struggle between the Church of Jesus Christ and the godless materialism that would destroy men's souls. Leadership in this great moral struggle must come only from a revitalized church.

Christianity has not failed so far. We have failed. We have failed to put it into practice in our daily experiences. Too many of us have been unwilling to pay the price for it.

We have failed to put it into practice in our homes. That is why we have one out of every three marriages terminating in divorce, and juvenile delinquency is an acute problem.

We have even failed to put in into practice in our very churches in many instances. That is why we have disunity and ineffectiveness in much of our work.

We have failed to put into practice in management-labor relations and that is why we have work stoppages, vindictiveness, bitterness between these two great groups in our society.

We have failed to put it into practice in politics and government. That is why we have dishonesty and corruption, disregard and disrespect for law.

We have failed to put it into practice in our treatment of minority groups. That is why we have race riots, intolerance and bigotry.

We have failed to put it into practice in our international relations. That is why we have war.

In all these great areas of human relations, we, as Christian laymen, have the opportunity to effect a miraculous change in affairs by practicing Christianity, in setting an example for the rest of the people who do not believe or who pay only lip service to the teachings of Jesus.

Just a Match

Take a look at a match. It's a cheap, necessary, and innocent looking little article. Yet matches have caused the destruction of hundreds of millions of dollars worth of property and tens of thousands of lives.

The same thing is true of cigarettes. Great forests, homes, factories—all have gone up in smoke and flame because people didn't go to the small trouble of putting smoking materials completely out when discarding them.

How about the cords that carry the juice to your lamps? Their cost is small and they can be installed in a matter of minutes. Yet, easy a sit is to replace them when frayed, short-circuits also have a gigantic toll of destruction to life and property to their credit.

These three examples show the main causes of fire—and the ease with which such fires can be prevented. The vast majority of fires are the result of one thing only—the human factor. Someone is lazy. Someone is careless. Someone puts off till tomorrow what should be done today. Then fire strikes. The loss may be great or it may be small. In either case, it is totally unnecessary. Keep that in mind when smoking, when checking household equipment, or when doing anything that has a bearing on fire hazards.

Every Individual in the Land

Some time ago, President Truman said, "Safety from fire should not be a topic for discussion during only one or two weeks of the year. It is definitely a year-round public re-sponsibility. I believe that the highest State and Municipal officials must assume greater responsibility for leadership in this field. We in the Federal government can give aid within the framework of existing agencies. But the impetus must come from the States and from every community and individual in the land."

Today, in the face of the greatest fire waste in our history, organized fire prevention activity has rapidly increased. Last year, 1832 cities participated in Fire Prevention Week as compared with 715 the year before. An aggressive program for teaching fire prevention in the schools and colleges of the country is in operation. Significant the training of firemen, both paid progress is reported in improving and volunteer. Research into the causes of fire has been extended. A great deal of valuable work is being done to perfect building codes.

Much of this activity falls into the province of experts. However, there seems to have been an encouraging increase in public interest in the whole field of fire prevention. Let us hope that the people of the United States are coming to realize that fire threatens everyone—and that everyyone must take part in combating it.

In the months and years to come, the statistics will tell the story. In the meantime, the great task of reducing fire loss must be aidcd by every individual in the land.

The Association For The Study Of Negro Life And History

Annual Meeting of the Historians Dealing with the Past as Influenced by the Negro

The Annual meeting of the Association for the Study of Negro Life and History will take place in Washington, D. C., on October 29-31. The entire week-end will be devoted to addresses and discussions dealing with various aspects of the past of the Negro as reflected today in what is transpiring in this country and abroad. The public is cordially invited. No admission fee will be required except that where meals are served the persons participating will pay for their repasts. Properly accredited representatives from other cities will be served free of charge. Two mass meetings will be held at the Shiloh Baptist church on Friday evening, the 29th and on Sunday afternoon, the 31st. The day's sessions will be held at the Phillis Wheatley Association, at 901 Rhode Island Avenue, N. W.

This annual meeting is being sponsored by the various schools and business and professional circles of the city. Representatives from the Howard University, the Public Schools of the District of Columbia, and from city-wide organizations will sponsor the meetings. Because of the enthusiasm thus aroused in both the national capital and nearby points a successful meeting is assured. The work of the Association is warmly supported in these adjacent areas which assure a creditable attendance of the scores of earnest workers who teach the background of the Negro in the schools and play it up in the press and on the rostrum.

The program as now scheduled will deal with the demographic study of the Negro population in the United States, recent social changes in the South, the role of the Negro in the defence of the nation, the achievements of the race in drama, the Negro in Latin America, the Negro in the war-torn world, and the best methods for teaching the Negro about himself and about others in relation to himself. The participants include the following: Professor Randolph Edmonds of Florida A. and M. College, Dean J. Newton Hill of Lincoln University in Pennsylvania, Dr. Mercer Cook of Howard University, Dr. Lorenzo J. Greene of Lincoln University in Missouri, Dr. L. D. Reddick of Atlanta University, Prof. A. H. Gordon of Alcorn College in Mississippi, Dr. Preston Valien of Fisk University, Dr. R. C. McConnell of Morgan State College, Dr. L. P. Jackson of Virginia State College, and Dr. Benjamin Quarles of Dillard University.

At this conference also will be awarded four history prizes; One Hundred Dollars for the best article contributed to THE JOURNAL OF NEGRO HISTORY during the year ending September 30; Fifty Dollars for the next best article thus submitted; Fifty Dollars for the best review submitted to this magazine during the same period, and Twenty-five Dollars for the next best review.

C. G. WOODSON, Director.

Dr. R. B. Atwood Makes Announcement

Frankfort, Ky., October 6, 1948. Dr. R. B. Atwood, Secretary of of the Conference of Negro Land Grant College Presidents, announced today that the 26th Annual Conference will be held October 19, 20, 21, at the Federal Security Building, Washington, D. C.

The conference theme is "Federal Relationship To Education" which will be led by the President, Dr. Luther H. Foster of Virginia State College.

Keynoting the first session, Tuesday, October 19th, will be an address by Dr. George Zook, President of the American Council on Education, also a report on the Social Studies Project by Dr. E. Franklin Frazier of Howard University. In the afternoon session with President L. A. Davis of Arkansas A. M. and N. College presiding, Dr. R. M. Stewart, Professor Emeritus of Cornell University and his staff will give a report on "The Special Project in Agriculture Education." This will be followed by a discussion led by President H. D. Gregg of Delaware State College.

Opening the second session on Wednesday, October 20th, will be President C. V. Troup of Fort Valley State College. Mr. Herbert O. Reid and Mr. James M. Nabrit of Howard University will deliver a joint address on "Remedies Under Statues Granting Federal Aid to Land Grant Colleges." Also on the day's program will be an address by Dean George M. Johnson of the Howard University Law School. The discussion period will be led by President R. E. Clements of Atlanta University. The afternoon session will be highlighted by an address on "The Courts and Equal Education Opportunities for Negroes" by Attorney Thurgood Marshall, Chief Counsel for the NAACP, also on the afternoon program will be a closed executive session for presidents and their ficially invited guests.

Dr. J. T. Williams, President of Maryland State College, will preside over the closing session, with Dr. George Mitchell, Executive Director of the Southern Regional Council delivering the final address of the conference on "The Chnages in Land Ownership by Negro Farmers in the South During the Past Decade". Disscussion period to be led by Pres. James A. Colston of Georgia State College.

The Officers of the Conference are:

Luther H. Foster, Virginia State College, Petersburg, Va., President

Lawrence A. Davis, Ark., State College, Pine Bluff, Ark., Vice President.

Rufus B. Atwood, Ky., State College, Frankfort, Ky. Secretary

Felton G. Clark, Southern University, Scotlandville, La., Treas.

To freshen up your feather pillows, air them on a cloudy, windy day rather than allowing them to hang in the sun. The sun draws the natural oil out of the feathers and destroys their resiliency.

A. & I. Pays Homage To Olympic Contenders

Gov. Jim Nance McCord joined Tennessee A. & I. College on Oct. 5 in paying homage to its two Olympic contenders Miss Audrey Patterson, sophomore; and Miss Emma Reed, Senior, in a special assembly program.

Gov. McCord declared that the young women had brought not only honor to the institution but to Tennessee and the nation as well.

He added that the entire state is proud of their accomplishments. "Their name will be written high and well in the history of the United States in an international sort of way. I congratulate the young ladies for their courage. And I congratulate the institution for its program which made their performance possible."

Three gifts were awarded each of the young women. President Walter S. Davis presented them with a Hamilton wrist watch on behalf of the entire college. A Sheaffer fountain pen was given by the Athletic Club, and a portable radio by the Inter-fraternal Council.

Miss Patterson and Miss Reed were introduced by their track coach, Thomas Harris. Harris denied any special credit for the girls' accomplishments. He acknowledged the cooperation of Henry A. Kean, head of the physical education department, President Davis, Gov. McCord, and Red Sanders, Vanderbilt's track coach.

Continuing his remarks, Harris quoted a letter from Miss Frances Kaszabskia of the U. S. Olympic Committee. The following excerpts described a slow motion picture of Audrey Patterson, third place winner in the Olympic's 200 meter run.

"She looks beautiful, every stride a thoroughbred stride. . . . I have never seen anyone run so beautifully.

President Davis congratulated Miss Patterson for distinguishing herself as "the fastest woman in America today." He pointed out that both girls had upheld the principles of the college by turning in an "A Class performance in a deluxe fashion."

Turning to Gov. McCord, he stated that the entire expansive program at A. & I. would be but a ghost if it had not been for the generosity of his administration. He rated the governor among the great statesmen that Tennessee has produced.

Expressing their apprcciation for being able to represent the school, the girls modestly acknowledged their honors. Recognition was also given to the presence of leading educational and civic leaders on the platform.

A. & I. Wins First Prize

A and I. State College won first prize for displaying the most outstanding exhibits at the 35th annual Tri-State Fair held in Memphis, last week.

Each of the ten divisons of the college presented different exhibits portraying what students were producing and studying in the classroom and shop.

One of the most popular exhibits was the one staged by the division of engineering. Engineering students demonstrated the use of apparatus concerned with giving preliminary test and training to prospective aviators. This was supplemented with pictures, an aeroplane motor, and a two-way radio used largely in connection with getting messages to and from planes in flight.

Other colleges participating in the Fair were Arkansas State College Pine Bluff; LeMoyne College, Memphis; Lane College, Jackson; and Alcorn College, Alcon, Miss

Illusion of Height

Women who want to appear taller should always plan their ensemble of hat, bag, dress and shoes in the same shade of color. Contrasting accessories make the figure appear shorter.

Using Hay for Pasture

By J. M. Jenkins

Experiments show that stock does better if allowed to eat some hay along with hegular feeding period and pasture feeding. If a pasture of grass is near by so that animals can pass from one field to the other at will, the self-feeder method can be applied to pasturing. Wild hay, straw grass, stubbles or roughages may be used with hay or pasture.

One of the most difficult in feeding hay as pasture is that they are not palatable. Even some livestock demonstrate a dislike for sweet clover. When feeding the animals for growth, it is important to keep a supplementary feed in front of them. Sweet-clover does not bloat cattle so readily as alfalfa. Comparatively little bloating occurs when feeding, but some should be expected. When turning cattle into a field for the first time, one should be very careful and not permit the animals to eat all they want at one time. Stock is known to take to most legume hays when they are in full bloom.

Lespedeza is a asummer annual for cattle feeding. There are several varieties. Many stockmen prefer a mixture of varieties, claiming that the different varieties produce at different seasons. Most lespedeza should be pastured in July and August after the small grain has been harvested. For best results a light rate of seeding of small grain should be used to avoid crowding the young plants. Not more than a bushel of oats or three pecks of wheat should be sown per acre. Do not pasture lespedeza so close that it cannot produce seed. This is noticed best by observing the stem part of the plant. If they get slim, remove the cattle.

Pasturing Vetch and Winter Peas

Pasturing vetch and winter peas —Both of these crops are useful for hay, pasture, and soil improvement. They are often useful for winter and spring pasture. Vetch should be planted in August to obtain good winter pasture. Winter peas should not be planted until September. To make good pasture they should be planted with a wheat drill, broadcasted, or planted in rather narrow rows.

These winter legumes are more easily injured by close grazing than grasses such as wheat. They should be pastured carefully to prevent injury by trampling and close grazing. Peas and vetch are suited to a combination of pasture and soil improvement. Cow peas and soy beans may be pastured, thus save the expense of putting up the hay. Bush clover is useful in many places for good pasture. A good farmer has a good pasture.

Young Negro Vet A Wall Street Business Wizard

Chicago—Modern Midas is 27-years-old Dunbar McLaurin, a Negro vet who is featured in December Ebony as an ex-GI who amassed nearly a million dollars in the few years since his discharge from the army at the end of World War II.

Holder of a Ph. D. in economics, McLaurin is the head of the Far Eastern Trade Association and operates offices in New York, Manila Shanghai and Hong Kong. A native of Oklahoma, when he was discharged as a lieutenant in Manila he went into the used car business selling army surplus jeeps. Known there as "Honest Mac—The Poor Man's Friend," he cleared $18,000.00 in his firstdeal and has been in the business ever since.

McLaurin's sales manager is white and works with him in his New York office just off Fifth Avenue which has a staff of five. His staff of Filipino workers in the Pacific boasts 400 workers and a weekly payroll of $22,000.00

Office, 403 Charlotte Avenue.

Devoted to the interests of the Farmer, Truck Gardner, Livestock and Poultry, Breeder, the Home and the People.

Entered as Second Class Matter, April 10, 1929. at the Post Office at Nashville, Tenn., under act of ... 3, 1879.

All contributions for publication in the Modern Farmer, should be addressed to The Modern Farmer, 403 Charlotte Avenue, Nashville 3, Tenn.

No libelous matter will be published. Unsigned articles or letters, and those written on both sides of the paper will not be used.

Subscription price $1.00 per year, 75c for six months, payable in advance. Personal checks must be certified. Make all checks or money orders payable to The Modern Farmer.

Advertising rates and sworn circulation figures presented upon application.

Statement of Ownership

The MODERN FARMER as required by the Act of Congress, Aug. 24, 1912, State of Tennessee, County of Davidson:

Personally appeared before me, a Notary Public in and for the State of Tennessee, County of Davidson, S. B. Wilson, who having been duly sworn according to law deposes and says she is Treasurer of the MODERN FARMER and the following is to her knowledge and belief, a true statement of the Ownership, Management, etc., of the said publication for the date sworn in the above caption requested by the Act of Congress, August 24th, 1912, embodied in section 443 Post Office Laws and Regulations:

1. That the name and address of the publisher and treasurer of the Modern Farmer is Nashville Tenn., S. B. Wilson, Treasurer.

2. That the owners are Henry Allen Boyd and S. B. Wilson both of Nashville, Tennessee.

3. That there are no known bonds, mortgages or other security holders or owners holding 1 per cent or more and that there are no bonds, mortgages or other securities on the corporation.

(Signed)
SADIE B. WILSON.

Sworn before me this 23rd day of September, 1948
My commission expires, Apr. 11, 1951.

Wake County 4-H'ers

(Continued from page 1)

Robert Pretty, Jefferies Grove 4-H Club, good blooded Holstein heifer. . Second prizes were won by Charles Dunn, Riley Hill 4-H Club, purebred Jersey bull and Fennell Pretty, Jeffries Grove 4-H Club, good blooded Jersey heifer. The show was well represented with animals from all parts of Southeastern North Carolina.

The Wake delegation was supervised by W. C. Davenport, Negro County Agent and E. E. Evans Assistant Negro County Agent both of the State College Extension Service.

New Technique

(Continued from page 1)

about 20 feet above the fields. The mixture is a "selective killer". It immediately attacks the weeds that rob fertility from such slender, thin-leaved grains as wheat, corn, barley, rye and oats.

Wheat farmers have reported increases of more than 25 per cent as a result of air spraying. In the heart of the wheat belt of Kansas, fields rendered non-productive by weed growth have been restored to normal yield through application of the liquid killer by air Grain thus treated arrives at elevators free from weed seeds eliminating "dockage". The new meth od has also salvaged thousands of acres of pasture land, eliminating weeds and without injury to pasture grasses. Hundreds of abandoned pasture acres in the Flint Hills of Kansas have been saved in this manner.

The costly operation of ground spraying, in which a tractor or truck covers a mere 20 acre a day, is made obsolete by the new technique. A plane completes an an 80 acre spraying, from take-off to landing, in 30 minutes. Cost of the operation is about two dollars per acre. Farmers contracting for the service state that increased yields from fields more than offset this expense.

Associated with Martin-Senour in perfecting the new air-spraying method is Herbert Rawdon of Rawdon Brothers Aircraft, Wichita, Kansas. Rawdon, first to convert an airship for commercial dusting of fields in the past, has designed a lightweight monoplane specifically for spraying fields as small as 20 acres. For the first time small areas and large can be serviced with equal economy.

The new plane, which has been submitted to the Civil Aeronautics Administration for approval, is characterized by full visibility, whereas planes previously used hampered pilot struts, and other engne location, struts, and other design factors. By next year 250 units may be in operation, and each of the planes will be capable of treating from 500 to 1,000 acres in a six-hour day.

A school has been established in Wichita, Kansas, where pilots are being trained in the special techniques required by large scale commercial weeding.

The Martin-Senour Company has set up a storage system which makes the liquid weed killer available within a few hours anywhere in the grain belt. While an operator is spraying from the air, an additional supply of the chemical is rushed by truck to his nearest landing point for refueling the tanks. The newly resigned airship will carry 80 gallons of liquid mixture and travel at the speed of 115 miles per hour. It requires only 300 feet of runway for take-off and landing.

"This marks the first time commercial weeding by air has been undertaken on a vast area basis utilizing liquid chemical killers," according to Harold Johnson, Western District Manager of Martin-Senoir and experienced pilot, who with Rawdon developed the spray-by air technique. "It is a significant step forward in the application of industrial aviaion to the progress of scientific agriculture. The air-spraying technique outmodes old-style dusting methods by being more economical, rapid, and highly selective. Liquid mixture can be controlled over fields in a manner never approached by chemical dusting, and its effectiveness as a killer of weeds which annually rob the American farmer of over three billion dollars cannot be overestimated.

Introduction of the airborne weeding technique promises a new and profitable era in the production of grainstuffs critically needed throughout the world," he said

Higher Corn Yield

(Continued from page 1)

two-day session in Greensboro.

Much interest has been shown in the growing of corn this year. More than fifty adults and 4-H Club members have signed applications for entry in the county corn contest. These and other producers plan to follow the ten commandments listed below and help double the county's 1944 corn yield.

Ten Commandments of the 100 Bushel Corn Club

1. I will apply lime to my field where needed.

2. I will prepare a good seed bed for my corn.

3. I will use a good variety or a hybrid which is adapted to my area.

4. I will use 200 to 500 pounds of 6-8-6 or 4-8-8 at planting unless the soil test shows that another an alyses is better suited for my land.

5. I will side-place my fertilizer or mix the fertilizer with the soil and leave 1 to 2 inches free soil between the seed and fertilizer. I will not be guilty of killing the seed I plant by placing the fertilizer too close to the seed.

6. I will put enough plants on each acre so that no one plant will be required to work too hard.

7. I will not pull suckers which are the lower branches of the plant.

8. I will not let my corn plants starve, fire and die, but will apply a side-dressing of nitrogen, and potash where needed. when the corn is about 2 1-2 feet high.

(250 to 500 pounds of nitrate of soda; 200 to 400 pounds of Calnitro or ANL, or 125 to 250 pounds of ammonium nitrate.) Also 75 to 100 pounds of muriate of potash where needed.

9. I will not seriously injure the corn roots by late or deep cultivation, and will not pull fodder or cut tops.

10. I will discuss better corn production methods with my neighbor and encourage him to become a member of the 100 Bushel Corn Club of North Carolina.

Two Hundred Colored

(Continued from page 1)

overnight before continuing to New York to board one of PAA's trans-Atlantic flights.

The "back to Liberia" movement started last March when an advance echelon of 21 men, women and children left Kingston on a special PAA flight to establish themselves in the only free Negro republic of Africa.

Word of jobs and prosperity in Liberia has encouraged the migration, and it is estimated that approximately 200 Jamaicans will Clipper to the republic wthin the next few months.

The colony was first established with the help of the United States Government and American philanthropic societies in 1820. A migration similar to the one now under way took place after World War I, when large numbers of Negroes settled in the republic to escape widespread unemployment and the depression that threatened in the Western Hemisphere.

Liberia has rich forests of ebony teak and mahogany. Its minerals include copper, tin, zinc, gold and diamonds. Almost all of the New World settlers, however have established themselves in Monrovia, the capital, leaving the undeveloped hinterland to the natives. In their new homes they have engaged in missionary work, nursing and various trades.

Summer Special

(Continued from page 1)

has met with favorable approbation. It is a tribute to the sound thinking of the President of the College and the Board of Trustees that they decided to establish a Graduate School of Agriculture at South Carolina State A. and M. College.

Under the leadership of Dr. M. F. Whittaker, its far visioned President, in cooperation with the State Division of Vocational Education, courses in Agricultural Economics and Agricultural Engineering were taught by F. Marcellus Staley, newly appointed Dean of the School of Agriculture at State College, and K. Martin Keyes, Professor, Agricultural Engineering, Tennessee A. and I. College, Nashville, Tennessee.

Definite plans are in the making for developing at South Carolina State College, one of the finest Schools of Agriculture in the nation, where Negroes may go for training and information, both on the undergraduate and graduate level. Dr. Whittaker and the members of the Board of Trustees have pledged their support.

Teachers who pursued these courses were: Leon F. Gardner, Allendale County; George Curry, Colleton County; Isaac C. Gillespie, Colleton County; Cornell E. Bellamy, Morlboro County; T. C. Paris, Calhoun County; Grady A. Yeargin, Greenville County; Timothy B. Brown, Laurens County; William J. Richardson, Marion County; Henry H. Taylor, Marion County; William Frederick, Timmonsville: J. T. Franklin, Darlington County; C. H. Hallman, Aiken County; L. C. DeCosta, Orangeburg; Ashley Aiken. Orangeburg County, J. S. Roberts, Orangeburg County; I. W. Harrison, Orangeburg County; R. P. Dawkins, Spartanburg County; J. C. Greenlee, Colleton County; Robert Ashley, Orangeburg County; Easom R. Barr, Greelyville; Wilbur T. Taylor. Spartanburg Co.; Philip T. Seabrooks, Hampton County; W. F. Hickson, Chesterfield County; Cl. L. Wilson, Williamsburg County; Henry W. King, Claredon County; Woodrow Z. Wilson, Berkeley County; Benjamin F. Hazel, Hampton, County.

Montasse D. Charlot, District Agent,

(Continued from page 1)

methods; three more are due here by September.

Students of the United States also are studying in Latin America under the program. Thirteen will study south of the border this year on State Department scholarships.

Mr. Charlot is the fourth Haitian to come here under the program. Others who have come were Gabriel Nicholas, Rodina Conte and Lucein Cantave. All of them have received important promotions in their work since studying here. Many other Latin-Americans, who have come here for study, also have been promoted in their countries.

Mr. Charlot, who has been a district agent for 10 years, supervises 12 county agents in his country. In addition to studying extension methods, he also hopes to learn a great deal about cooperative credit associations, and about the production of tobacco and potatoes while he is here.

Dr. Frutchey says that the program is a part of our Government's cooperative relation with the Governments of other cuntries in an effort to provide opportunity for qualified men and women from other countries to come to the United States and recieve instructions and practical experience in better farming practices and in extension work in agriculture and home economics.

The purpose of the program, he says, is to develope better understanding between the people of the United States and the people of other countries in promoting hemispheric soldarity and world citizenship as a part of the extension program.

The New Railroad Rates

The Interstate Commerce Commission has made permanent three emergency freight rate increases it had granted the railroads. Rates will be about 25 per cent higher than they were prior to the first increase. The railroads had asked for 30 per cent.

The ICC took final action only after many months of the most exhaustive investigation. Hundreds of witnesses, representing all interested parties, were heard. Thousands of pages of testimony were taken and studied. And the conclusion was that the railroad industry and commerce depends, could not continue to operate efficiently without substantial increases in revenue.

Whether or not the 25 per cent increase will be adequate remains to be seen. At best, it will give the railroads a net income below that generally considered fair for regulated public utilities. But, irrespective of that, the ICC's decision is indicative of the fact that industry must pass on to its customers the largest part of the tremendous increases in the cost of materials, labor, and taxes that have taken place in late years.

It would be a short-sighted man indeed who would deny the rails a living wage. Their great wartime performance made the final victory possible. They are today carrying one of the greatest peacetime loads in history. They must spend enormous sums for improvements and new equipment. Their charges for service must be adequate to pay the bills and return a moderate profit.

Fire's Best Target

Fire prevention must begin in dwelling places.

The last annual report of the State Fire Marshall of Oregon backs that up. In 1947, more than 74 per cent of all insurance claims in the state had to do with fires in dwellings, apartments and flats. By contrast, the second category--losses in mercantile and office buildings--accounted for but 6.5 per cent of the claims. From the standpoint of money loss, the home fires came to nearly 30 per cent of the total for the state--about double the figure for the next highest classification.

These proportions will vary from state to state, but the home is fire's most effective target. Rundown heating equipment, substandard edectrical facilities, carelessness with smoking materials and flammables these causes alone are responsible for thousands of home fires each year. And in many of those fires, lives are lost.

The authorities can't inspect every home. They can't make you put your heating system in order before fall comes, or replace frayed wiring, or clean the junk out of attics and closets and basements, or do any of the other simple things that will go a long way toward making your house safe. All they can do is advise, and tell you what precautions to take. From there on, it's up to you.

If you think fire prevention is worth while, start checking on your own home now. The chances are you'll be amazed at how many hazards you find.

Minnesota Farmers Emulate Forefathers for God-given Crops at Thanksgiving

By Eugene Meyer & A. F. Jones

Minneapolis — When they look at the estimates of the 1948 wheat crop, leading authorities here in Minneapolis shake their heads in something that is closely akin to that reverential humility that actuated our forefathers on that first Thanksgiving day.

Another tremendous wheat crop on top of the 1947 record breaker! And this on top of the splendid wheat crops that have continued through the war years and in territory that is accustomed to the too frequent years when drouth or blight or bad growing seasons have resulted in failures or partial crop.

Modern mechanization helps planting and harvesting a wheat crop, but it has nothing to do with giving it the moisture it needs at proper intervals.

The Northwest has had a deficiency or rain this summer—a deficiency of seven inches here in Minneapolis out of an average annual rainfall of 27 inches. Ordinarily that would be disastrous.

Rains Came At Right Time

But the rains came at the right time. When the oats crop was turning brown and the wheat into a waving sea of green and healthy grain.

So beneficient has the weather been that the corn crop is wo weeks ahead of usual growth and even such states as North Dakota, where a ripening crop is usually threatened by frost, now feel sure of their corn crop.

So the attitude of the men who have spent their lives in the growing and mechandising of grain and grain products is understandable. And it is shared by everyone in the Southwest, where winter wheat crops were threatened with a dust bowl drouth late last fall and where rains came at precisely the righ time.

Now the best estimate of private experts is that the wheat crop will exceed the estimate of the department of agriculture and result in a yield of 1,289,000,000 bushels, which, with last year's carryover, will give this country more wheat in 1948 than last year.

The little band of men who had landed at Plymouth gave thanks for the meager supply of corn, the pumpkins and oher vegetables and the turkeys and other meat supplies that insured them some degree of comfort in the winter ahead.

Today 146,000,000 Americans are assured an abundance of every essential need through the most magnificent all-around crops in history. This country can not only care for all its own wants, but it will be possible for us to reach out and feed hungry men and women and children in wartorn Europe, in England, in India or Japan or China.

From the standpoint of foreign relations, this wheat crop is vital. It means that in all the bread eating countries of Europe the United States will be able to strengthen the hands of Marshall plan administrators, by supplying wheat that will increase the European bread ration. Europe has good crops this year and will not be dependent on the United States, but European wheat crops will not be sufficient to make it possible to go wothout heavy imports. Italy lives on bread and will need help. The agriculture department figures that the United States may export 450 million bushels abroad from this year's crop.

Everyone Should Be Happy

Altogether, the 1948 crops should make the coming Thanksgiving a happy one not only in this country but abroad.

Here in Minneapolis, wheat is ground into flour; great elevators hold millions of bushels in storage: mill produce feeds for livestock, linseed oil from flaxseed, packaged cereals, and many other grain products. It is also the headquarters for the far-flung Land o'Lakes co-operative which markets more than 100 million dollars worth of butter, dried milk, turkeys, chickens, eggs, and cheese annually. Minnesota is the leading butter state.

So there is no better center in the country to check on the price situation on these vital commodities which eventually land in the housewives' shopping basket.

Turkeys To Be Scarce

We have been talking about Thanksgiving, and it is an ironic fact that there are only 50 per cent of the turkeys on American farms this year that there were in 1947. They are going to be scarce and expensive this Thanksgiving when most things are going to be available in abundance.

The reason for the scarcity of turkeys, and chickens too for that matter, is given as the outgrowth of the poultryless days last year and chickens are not on the farm. feed. Now that feed is going to be cheap and lots of it, the turkeys and chickens ar enot on the farm. But the hatching of eggs and increasing of chicken flocks is not a long biological process. On the farm the chicken and turkey business is largely the farm wife's job. She will be back on the job in a big way very shortly, although it is too late for this year's turkeys.

The break in poultry prices is predicted for right after Christmas. The same thing is predicted for eggs. Although eggs have a government support price, the increasing production expected next year may very well create a situation where the support price will have to be lowered.

Agricultural Act Extended

As a matter of fact the Agricultural Act of 1948, passed by Congress and signed by the President, in this political year extends through Dec. 31, 1949, with 90 per cent of parity price for hogs, as well as chickens, eggs and milk. With dairy and poultry feeds available in great supply at lower prices, questions will be raised as to the present government support price policy.

The price of mill feeds, used mostly for dairy and beef cattle, reached a high of $85 per ton last year. Now they are selling for $38 per ton and are expected to go lower. The hay crop is good this year and the prices arearc expected to drop drastically from a high of $30 per ton. Poultry is fed corn and wheat and both are plentiful and cheaper.

Butter Below Normal

The story on butter is another case where production is considerably below the pre-war level—'0 per cent below, so far as Minnesota manufacture is concerned. This goes back to war time, when it was impossible to get the needed help to run dairy farms. Dairy herds were culled of poor producers and the beef price became more attractive as time went by. It was quick money, instead of the moderate monthly milk check. Feed prices were going up constantly. Pastures were valuable for grain raising.

And so the milk production went down. The prices of whole milk went up so fast that sale to the milk distributors became a big factor. And more milk went into cheese, an industry that is now developing at a rapid rate in Minnesota.

There is no doubt, either, that the increase in the sale of oleomargarine had a pronounced effect on the production of butter.

Had Eye on Future

But again the farmer had his eye on the future. He kept his good producing cows. He is ready to start keeping his heifers and promising young stock and, with feed more plentiful, and cheaper, the production of all dairy products will start up.

The butter producers in Minnesota cannot afford to allow butter production to lag. They have too big a stake in plant, in distribution facilities, and in advertised brands. They know that unless they keep constant pressure on their butter, some other district will take their business away from them. Butter is a gold mine for this state and far outstrips wheat in money importance. So count on quick increases in the supply of butter and on prices that will be pretty close to those set by government support by next spring when pastures are good.

Butter in Storage

At the present time, there is about 70,000,000 pounds of butter in storage in this country, as against a pre-war average of about 170,000,000 pounds.

One of the biggest crops in the Northwest this year is flax—one of the most hazardous crops to raise. It may well be the biggest money crop in Minnesota, and that is also true of North and South Dakota. The flax crop in these three states is estimated at 34,000,000 bushels. There is a guaranteed price of $6 per bushel on flax, and flax farmers will net small-sized fortunes. As a result of the big flax crop there will be a bigger supply of linseed oil, most of which goes into paints and varnishes. This has nothing to do with food, but is another facet to the fortune possition of the farmer in this year of 1948.

This great crop has changed the entire atmosphere here in Minneapolis, as it undoubtedly has in every agricultural community.

Removed Uncertainty

It has removed the uncertainty that has been a heavy burden on farmers and food processors alike.

They have all made money—big money—in these postwar years, but their operations have been subject to unusual hazards.

Wheat acreage has been subject, to a large degree, to foreign requirements. Whether the farmer should raise more pigs has been a tough decision with feed costs sky high. Whether it would pay to continue to milk cows or sell them to the butcher and avoid labor costs has been another harassing problem.

Today the farmers seem fairly tranquil—for farmers. They see an abundance of cheap feed, they see settled government price policies for the next eighteen months. But they are aware of the fact that as the world returns to greater self-support in food production, the market for abnormal production from the United States, Canada, Australia and the Argentine will decline radically.

So the old cow pasture, which has been in grain these past few years, is going back to cow pasture. The farmer's wife is going back in the poultry business, and glad of it. They are planning to put more milk cans out by the gate for the creamery man to pick up in the morning.

In other words, the hectic postwar conditions may be really coming to an end.

In the same way, the executives who control the big food processing corporations are no longer so jumpy and so obviously under strain. They feel that lower prices are coming. They have made money in the past by putting out the best possible products at the lowest possible price. They know that business thoroughly and like it.

And they tell you frankly that no product ever made a friend of a consumer who felt he was being gouged on the price. They know that although national indexes show that income is way up and demand for all food is high, there is a big class of white collar workers — ministers, teachers, clerks, professional workers, who are struggling desperately, to make ends meet.

These executives would rather get a cheer from consumers than a pay raise from the board of directors.

It points up to a more healthy situation—and it was all caused by rain at the right time, sunshine at the right time, and the resultant greatest all around crop in American history.

There isn't any such thing as something for nothing. Someone pays.

Sliced frankfurters may be combined with baked beans and some crisp vegetables, such as celery or carrot or cucumber, for a salad. Use French dressing on it and serve on greens.

How To Fish For Men

Fishing for men is an art which can be mastered by any Christian who is willing to follow the Lord out into the harvest field. Winning men to Christ is a man-sized job; and it is done by Christians who see the beckoning hand of Jesus and heed his gracious words, "Follow me, and I will make you fishers of men" (Matt. 4:19).

Who is going to win lost men to Christ? The plain truth is that lost men are not likely to be won unless Christian men go after them. Yet when Christian men go to a lost man and press the claims of Christ upon him, they often find him willing to yield to the Saviour. That is how Willard was won to Christ.

Willard is a section-hand on the railroad. He is the husband of a fine Christian woman and the father of four little children. Until recently, Willard was a lost man. One day, when two men went to Willard's home to invite the family to church, they discovered that Willard was not a Christian. After a few words of testimony and prayer, the men left to visit other homes in the community.

Willard went to church; and the Holy Spirit brought him under deep conviction. Soon afterward Willard received another visit from two Christian men. The men faced him with the fact of sin in his life. Willard admitted it. Then they drove home the scriptural truth that sin brings death; they warned Willard that being a guilty sinner, he was lost and on his way to hell. Willard acknowledged this awful reality. The men next laid before Willard the facts of the gospel: that Christ died for Willard's sins, and was buried, and was raised again on the third day. Willard confessed that he believed these truths, and that he needed Jesus as his Saviour. Finally, the men presented God's terms of salvation: repentance toward God and faith toward the Lord Jesus Christ. Willard agreed that he ought to repent of sin and trust Jesus, and that he ought to do so without further delay.

So one of the men led in prayer, asking God's grace upon Willard. After the prayer, Willard surrendered unconditionally to the Saviour. It was joy, indeed, to see the embrace of the Christian wife and Christian husband. At the evening service Willard presented himself to the church.

The story of Willard's conversion is true. And in this story we can find the elements of successful fishing for men. The elements are: **going, witnessing and praying.**

Men are not generally won by preaching alone. The charm of the preacher, or the quality of his message, or both, will not bring to pass that which requires also the going and the praying of God's people. The first preaching that many lost men will ever hear is the simple witnessing of Christian men who go to them with the Word of God.

Men are not won by prayer alone. God is willing and able to answer the prayer of his people when his conditions are fulfilled. Yet, while prayer is absolutely necessary, prayer alone is not enough. Preaching and praying, together, are not enough. There is yet another basic activity of soul-winning.

Jesus says, "I have chosen you, and ordained you, that ye should go and bring forth fruit" (John 15:16.) Somehow, in God's spiritual economy, going and fruit-bearing are inseparably linked together.

Going — witnessing — praying! Any church can have a genunine and continuing revival if a few of God's people will go to those who are lost, and witness to them of the saving grace of Jesus, and pray for them and with them. When these things are begun, a revival will come, no matter what the condition of the church, no matter what hold the devil may have on the community, no matter what the time of year, no matter what the weather may be! Therein is the formula for a revival.

Dr. Fred L. Brownlee To Be Charter Day Speaker At Atlanta U.

Three Alumni to be Honored at Charter Day Dinner

Atlanta, Georgia, September 30—Dr. Fred L. Brownlee, general secretary of the American Missionary Association, Division of the Board of Home Missions of Congregational and Christian Churches, and a former president of LeMoyne College. will be the convocatoin speaker at Atlanta University on Charter Day dinner at 8:00 p. m., Thursday, October 14. according to an announcement. The exercises will be held in Sisters Chapel on the campus of Spelman College and will be open to faculty, students and friends of the University. Alumni will be special guests on this occasion. At the Chartor Day dinner at 8:00 p. m., on October 14 at the University Dormitories, when the day's celebration will be climaxed, the University will honor three alumni who have attained distinction as heads of state colleges in Georgia. They are President Aaron Brown of Albany State College, M. A., 1933; President Cornelius V. Troup of Fort Valley State College, M. A., 1937; and President James A. Colston of Georgia State College, M. A., 1933.

Dr. Brownlee, the convocation speaker, has given active service for more than 26 years as executive secretary of the American Missionary Association, which in 1946 celebrated its 100th anniversary. In guiding the policies and program of the AME schools, colleges, credit unions, cooperatives and other ventures in Christian living, he displayed the highest educational and social statesmanship. His recent book, **New Day Ascending,** is the contribution of the 100 years of history of the American Missionary Association.

Dr. Brownlee received his A. B., and M. A. from Ohio State University. He prepared for the ministry at Union Theological Seminary and Columbia University, serving later in pastorates in New York and Ohio. Two universities to honor him for his distinctive achievements are Howard University, which conferred the degree of doctor of human letters and Oberline College, which conferred the degree of doctor of divinity

Declining Prayer Meetings

It is anything but encouraging to the spiritually minded in the churches to see fewer and fewer interested in the midweek service, usually called the "prayer meeting." The faithful hang on, but even their faithfulness does not seem to stem the drift in indifference toward this service. When a church begins to lose its sense of responsibility for the ministry of intercession, its glory is departing, and with that goes joyous accomplishment associated with the presence of the Holy Spirit in power. People begin to speak of such a church as being "dead." Its services become coldly formal, icily correct, clouded as to heartwarming truth. Sinners are not attracted to such churches. Intuitively they feel that it is of little use to attend. God's Spirit does not providentially direct hungry-hearted sinners to such places. Ichabod might just as well be written over their doors. The glory has departed. It seems a pity to go to the expense and trouble of keeping going a defunct ecclesiastical organization. Yet there are many such, having a name that they live and are dead. They are a travesty on the faith. The only way such a church can be saved is for those who believe in intercession to begin interceding for their fellow members and by example, exhortation, and spiritual persistence to enlarge the prayer circle until God honors such faithfulness by consequences that signify his approval.

School Work Is Made Easier By Learning Split-Second Seeing

Training as Valuable Aid to Optometrist Describes Visual Child and Adult

By scientific training a child can be taught to be fifty times as quick as an average person in seeing and remembering a row of digits flashed on a screen, according to experiments conducted by Dr. Marguerite Thoma Eberl, Milwakukee, Wisc., optometrist.

Such training teaches a child to read faser and to comprehend better what he reads, she said. It also improves his spelling and, coupled with other visual training techniques, it can make beter students and better citizens of millions of school children, according to this **authority. Cites Air Service Record**

"Modern science has proved that seeing is a skill which is learned, just as a child learns to walk, talk or play a violin," Dr. Eberl said.

"Since good vision is learned it can be taught. The armed services proved this during the war when lfiers were trained in quick perception to distinguish enemy aircraft from our own. It is now being proved every day by hundreds of optometrists who provide visual training for their patients, especially school children."

Dr. Eberl said that seeing is not a simple process like a camera recording an image on a film. It is a highly complicated process involving many muscles and nerves whose proper co-ordination must be learned.

"Sometimes we fail to learn the most efficient visual behavior patterns or for some reason we develop bad visual habits," she said. "Scientific training can often develop the proper visual efficiency."

She said that visual training which involves numerous techniques is not a panacea for all visual problems, but it often achieves corrections for both children and adults which cannot be obtained by glasses.

Vision Depends on Skills

"Glasses alone will not solve the vision problems of many school children," she said. "It has been proved by clinical test that visual training, sometimes with and sometimes without lenses, is usually able to bring about desired improvement.

"It is old-fashioned to think that vision depends on the eyes alone, and that we are born with 'good' or 'poor' vision over which we have no control. Good vision is made up of skills which can be trained, and our ability to see and actually comprehend what we are looking at, depends to a large extent on how we develop and use these learned skills."

A certain top sergeant, now a tank fighter with the AEF in Ireland, took his wife in his arms as he was leaving, and said, "Every rising sun will be a kiss from me to you." Then, with no hint of his destination, he departed.—(N. Y. WORLD-TELEGRAM)

Stuff peach halves with cottage cheese and chopped pecans for a salad-dessert. Serve on salad greens and pass a fruit dressing.

The Spiritual Example Of Parents

Frankly, I am troubled. I have just listened to an outstanding phychiatrist as he talked to a group of ministers. He told us that recent phychiatric studies have definitely established the fact that the basic trends and attitudes of life in children are determined by the time they are six years old. The child after that age will grow and develop and change in many ways, but will follow in the main the basic mental and emotional pattern that has been developed in those first crucial six years of life.

Ever since I heard him speak I have been asking myself: What if that is really true? What does it mean to me as a parent? What are we doing in our church, in our Training Union and Sunday School, and in our homes to shape lives aright in those vital years? The obligation is certainly great on all of us as parents, teachers, and ministers to guide the growth of boys and girls under our care that they will be at their best as they build their own lives on the foundation of those early years.

Today's parents face a tremendous responsibility as they meet the tensions and temptations of modern life. They must give such day to day examples of Christian living that the attitudes and ideals will be what God intended. Their attitudes will be caught as well as taught. Their ideals will be firmly embedded in the life of the next generation (or as firmly rejected) largely as a result of the way they live and meet the tests of everyday living.

What a responsibility it is to make our lives and our homes Christian, to be better than the world about us, as we seek to make the world better, to free ourselves from inherited prejudices and fears lest they be caught and passed on to another generation. Surely "the love of Christ constraineth us" to make our lives as nearly like his as we possibly can. More than ever we need to heed the injunction. "Let this mind be in you which was also in Christ Jesus." Surely our training Unions and Sunday Schools, including as they do parents, future parents, and little children, can help to develop such lives.

Fathers and mothers have a special responsibility since they are closest to our little ones in those early formative years. Younger men and women are parents in the making and as such should determine to choose and be the kind of life partners the next generation needs. Leaders of children's groups have a direct responsibility to teach the faith and the hope and the love that are the foundation of right living.

Let us never forget that Christian homes are made by Christian parents. The level of life in the home will never rise above the level of our own individual lives. To that end we must be Christian first ourselves and seek to lead others in the home to personal faith in Jesus Christ. The task of evangelism reaches to the far ennds of the earth, but it begins at home. No one can take the place of consecrated fathers and mothers in the important task of training children for Christian life and service.

It is my privilege to sit as a member of the appointment committee of our Foreign Mission Board. Over and over again we are impressed with the fact that in the lives of the candidates we interview the majority of the decisions for Christ and mission service are made by children even before they reach the teen age, very often between the ages of six and ten. This only goes to prove that the psychiatrist is right in saying that the basic attitudes and patterns of life are determined early in childhood.

So many of us have reason to be thankful for the Christian parents and teachers and leaders who have shaped our lives. One example is worth a thousand words. Though we ourselves, every one of us, still look up to others with respect and admiration and shape our lives by their lives and ideals, we are prone to forget that others are looking to us. Our unconscious influence is often greater than that which we seek consciously to exert. "Let your light so shine before men that they may see your good works and glorify your Father." Heaven alone will reveal the full effect of your life on the lives of others.

As we work and pray for a better tomorrow, we can help shape Christian characters and create Christian homes. God grant that we may be used of him to transform many lives into the likeness of the Lord Christ. To this high end we all are workers together with God.

Muffins for breakfast can be made quickly if the dry ingredients are measured and sifted the night before.

Hamburgers are delicious topped with onion rings that have been sauteed and seasoned with salt, freshly ground pepper, a dash of sugar and a little soy sauce.

The tragedy of the flea is that he knows for certain that all of his children will go to the dogs.

THE COLORED

YMCA

Can Accomodate

TRANSIENT MALE PATRONS

When coming to Nashville you are requested to stop at the Colored Y.M.C.A., Fourth Avenue North and Charlotte Avenue.

The rooms are located on 3 floors. Splendid outside rooms with much of the modern conveniences.

It is located in near down town Nashville.
There are clerks on duty twenty-four hours every day.

The rents are reasonable.

If any man wishes to take permanent residence in the building, this can be arranged.

Come to the Colored Y.M.C.A. while in the city.

Nashville 3, Tennessee

NAACP Presses Prosecution of Pair Who Killed Voter

New York,—Seeking to establish the right to vote without fear of fatal reprisals, the National Association for the Advancement of Colored People announced today that it would assist in the prosecution of the murderers of Isaiah Nixon, 28 year-old Negro of Alston, Ga., who was slain by two white brothers on September 8 because he had voted in the Democratic primary election.

The case is scheduled for presentation to the Montgomery County Grand Jury during the first week of November. Retained by Nixon's young widow, the Georgia State Conference of NAACP branches has employed W. A. Dampier of Dublin, Ga., to assist the State in the prosecution of M. A. Johnson, charged with firing the fatal shot, and his brother, Johnnie Johnson, charged with being an accessory to the murder. Mrs. Nixon also authorized the NAACP to raise funds for the prosecution and for the maintenance of herself and her children.

The NAACP has also been retained to handle the case of D. V. Carter, president of the Montgomery County, Ga., NAACP branch, whose left wrist was broken when he was assaulted and beaten for carrying Negroes to the polls in his automobile on the day of the same election. In a letter to Mr. A. Abbot Rosen, Chief of the Civil Rights Section of the FBI, NAACP Assistant Special Counsel Franklin H. Williams wrote, "We request an immediate investigation by your office of this incident, and, if as a result thereof you find a Federal violation has been committed, prosecution of the parties guilty of this assault.

The case has also been called to the attention of the Georgia Bureau of Investigation.

"It is not enough to win the right to vote," Walter White, N. A. A. C. P. Secretary, said in commenting on these cases. "We must be able to protect Negro voters in the exercise of this basic right. Southern Negroes have time and time again demonstrated that they are not to be intimidated by threats and violence. It is the responsibility of all of us to see that they are permitted to vote without reprisals. All our resources must be mobilized to this end. Otherwise, the long struggle to establish the right to vote will come to naught."

Negro Players Make Big Nine Nation's Top Grid Teams

Chicago.—In the strongest grid circuit in the nation, the Big Nine, eight out of the nine competing schools are fielding colored backs and linemen this year, says a November Ebony photo-feature, and thank their Negro gridsters for their extra power and deception.

"Top Negro player in the midwest is Michigan's Gene Derricote, Ebony says, "who averaged six yard per try and scored five touchdowns last season though he had to give way to versatile All-American Bob Chappius. Injured this fall, Derricote has returned to the Michigan line-up and is responsible for the team's being picked by experts as the nation's greatest."

Also rated high by coaches and fans alike are George Taliaferro at Indiana, Paul Patterson at Illinois, Glen Pullens at Minnesota, Earl Banks at Iowa, Jimmy Dorsey and Stan Dixon at Ohio State, Calvin Vernon and Bob Teague at Wisconsin, and Jim Holland at Northwestern.

"Since Negro William H. Lewis playing for Harvard in 1892 was picked by Walter Camp as the best center in the country," Ebony says, "colored players have steadily cracked the color lines of the nation's colleges outside the South. Notre Dame is even reported looking for an outstanding Negro player in a Catholic high school.

The Passer-by

A shout_____a scuffle at the door of the shop_____a man ran ran down the street____somewhere a whistle sounded. A crowd gathered quickly. Voices rose in confusel argument. One stood ut —"I know my rights!"

From the outskirts of the milling crowd it was difficult to learn what it was that was wrong. Rumors seeped through. "It's a stick up!" The crowd murmured. At the center, the voices were penetrated with "I know my rights!"

The sound of sirens and screeching brakes broke in on the din. The crowd moved to make way for the police. More rumors came through. "It's something about a job they promised him." The sound of banishing clubs accompanied screams. Some one yelled "They're beating him! He's a Negro." "No, he's a Jew." A woman's voice remarked, "He's Eyetalian!" "Then why doesn't he go back where he came from?" The street echoed with voices—each with a diffrent version of the situation. Soon the clanging of a patrol wagon was heard. The crowd scattered and the voices ceased as interest centered on the little man who was being bustled into the wagon. Still his voice called out shrilly "I know my rights!"

The man on the rim of the crowd passed along. A newcomer approached him. "What's up, Bud?"

"Dunno. Some fellow's yelling about his rights."

"Humph!" The questioner strolled along, obviously unimpressed.

He left a puzzled man, however. There was someone enroute to the station house who knew his rights —or thought he did. What were his rights in a republic like ours?

The Declaration of Independence of the United States asserts that "Men are endowed by their Creator with certain inalienable rights. Among these are life, liberty and the pursuit of happiness. To secure these rights" it continues, "governments are instituted among men."

"I know my rights," the little man had screamed.

Do these "inalienable rights" referred to in the Declaration of Independence still hold? Since that Declaration, our people have reviewed their position three times. Then first scrutiny, at the ratification of the Constitution in 1791 resulted in the first ten amendments known as the Bill of Rights. Here in was affirmed freedom of religion, speech, press, petition, to bear arms; the sanctity of one's home, property and person and the right of prosecution, trial by jury, et cetera.

"I know my rights!"

Later during the Civil War when it became obvious that our nation could not survive "half slave, half free," the matter of civil rights marched ahead through the Emancipation Proclamation and more amendments to the Constitution. At the end of each article, there was affixed the phrase: "Congress shall have the power to enforce this article by appropriate legislation."

Last year President Truman appointed a Committee on Civil Rights. In its report, "Secure These Rights," it listed as basically essenial to the well-being of the individual:

(1) The right to safety and security of person

(2) The right to citizenship and its privileges

(3) The right to freedom of conscience and expression

(4) The right to equality of opportunity.

What rights had been violated that very day? What were the men in the crowd and Mr. Passerby going to do about it? How was it the Constitution read__"governments are instiuted among men." But a declaration and paper law are valueless unless implemented by action. Men! What men! Mr. Passerby was worried. He had never felt this thing personally before. He was really one of those "men"; but what could he do?

Just last week his wife told him about Ben, the boy next door. He was graduated with honors from a local high school. He wanted to be a doctor and had the future all mapped out before him. But at his first application to a university he was refused. On what grounds? Oh, there was something about a quota. He had shrugged his shoulders. "Too bad."

It was the same with that man down the street who had so many children. He was a mighty good craftsman but because he worshipped in a synagogue rather than a church, he just couldn't get to first bose. "It's tough."

Then there was Lucy, their maid. It was a shame that she had to go to work; but her husband couldn't make the grade. In Nashville he had been a skilled typesetter in a religious publishing house; but up North he found in his particular trade that more doors were closed than opened to him because his skin was dark.

Mr. Passerby bit his lip. He had sat silent in the monthly meeting at the club last week when some members urged the matter of "tightening up" their membership. The family under consideraion was "not our kind." Yet, he knew the man well—made the same train each morning. But couldn't actually live in the Manor. "That was "restricted"_____And he had sat silent.

Down at the office, at the Board meeting, he had voted "with the boys" **on the matter of keeping its "personnel of good old American stock." Kolinsky had deserved a** break. Able chap. Been with the firm for years_____ but, not the "board-member type."

Yesterday at Sunday school he had taught a boys' class on the subject of The Sermon on the Mount. That was a bill of rights if ever there was one! "Love thy neighbor," Jesus had said. "Love thy neighbor as thyself." Yes, civil rights really weren't anything new. In fact it went back to Mt. Sinai. It goes forward_____Mr. Passerby hesitated___it goes forward to an International Bill of Rights, a declaration of human rights throughout the globe. It goes forward if I make it so. The little man had screamed " I know my rights!" Do I know my rights? Does my neighbor know his rights? Do I help to put these rights into action? **Am I only a passer-by?** I cannot be, and remain an American—remain a Christian.

—Religious Press Committee

Fisk Community School Opens November 3

New Courses Have Been Added

Dean W. H. Shackleford announces that the Fisk Community Training School will open Wednes day night, November 3 in Livingsston hall, Fisk University at 8:00 o'clock. Old and new students will register as well as post-graduates. Two new courses have been added for their benefit

Six approved subjects will be taught by capable instructors for the first quarter. Students are not required to take examinations. Tuition is only 50 cents a quarter. Last year 100 students from every denominaion of 42 local churches attended the school. A larger enrollment is expected this year.

During his first campaign for mayor of New York City in 1929, La Guardia charged the popular Jimmy Walker with all sorts of corruption, and Walker never answered a single charge. "Why should I make his campaign for him?" he said to me. "I won't build him up. It would be fun, though, to ask him one question—what was he doing in Waterbury on July 16, 1928?"

"Was he there at that time?" I asked.

"I dunno," Walker replied. "But if I asked that question he could deny he was there until he was blue in the face. A lot of suckers would still believe there was something very fishy about him and Waterbury." — WILLIAM R. CONKLIN, WE SAW IT HAPPEN.

Who Eats For You

Inventory had just been taken at the plant where I am bookkeeper. My task now was to make sense out of the rows of figures. It would require much concentration and quiet. The time to do it, I felt, was Sunday morning, when my wife and the children were in church.

Of course, my conscience tried to speak against it, but my mind was equally capable of thinking up reasons to justify my staying home.

This is the Lord's Day, said conscience.

But if I lose my job I will not be able to support the church, said mind.

This mental argument made me remember my church offering envelopes, I got them from the desk drawer and carefully marked in the amounts. **At least my money will be in church.**

Conscience tried to say something about backing up my offering with prayers, but I did not pay any attention.

A few imnutes later, my wife entered the room dressed for church. A quick glance at the inventory papers before me told her that I planned to stay at home.

"Did I tell you what happened at McCallum's garage yesterday when I had the car greased?" she asked, "It was comical in a way.

"When I was ready to leave, I said to Mr. McCallum, 'So long, see you in church.' You know I say that to almost everybody.

"Well," she continued, "that reminded me that I had not seen him in church recently, so I asked him about it.

"Mr. McCallum said, 'I setnd my wife and daughter. Isn't that enough?"

"You know he's rather stout anyway, and when he said that, one of the other customers asked, 'Do you let them eat for you too?'"

My mind could not compete with my wife and my conscience. I noticed Mr. McCallum was in church, too.—The Lutheran.

A Picture In The Flames

By M. Clark

"Creak!—Creak!"

Robin looked out the window. Through the ranch gate came two burros, drawing a wagon. The wagon was piled high with wood.

On its seat were two figures, one large, one small, and both wearing large hats.

"Juan's come with the wood," Robin called to his mother, "and Pedro's with him."

Juan and Pedro busily began to pile the wood in the patio. The last armful they carried in for the fireplace.

"Hello, Pedro!" said Robin.

"Hello!" said Pedro!" shyly.

"Look a the new coloring book my aunt sent me for my birthday," said Robin. "I am painting in it now."

Pedro came over to the table. "I paint, too," she said softly. "I show you." He felt in the pocket of his old windbreaker, brought out a paper. Carefully smoothing it out, he gave it to Robin.

I was a picture of a dog.

"I only have blue crayon," said Pedro. "I have to draw dog blue." He looked wistfully at the spotted pony Robin was coloring.

"It looks just like a dog," Robin told him, "even if it is blue. Look here, this halter's going to be red, you can paint it." He held out the brush.

Pedro hesitated. Then he took the brush. Bending over the paint ing book, he carefully colored the pony's halter red.

"Do you like to paint, Pedro?" asked Robin.

"Mucho—very much," said Pedro, as he laid the brush down.

"Why don't you get your father to buy you some paints with some of the wood money?" asked Robin.

Pedro was silent for a moment. "We need grocery," he said.

"Oh!" said Robin. Suddenly he put the brush into Pedro's hand. "Paint the spots on the pony, Pedro, while you're waiting for your father. You can paint his eye, too."

Robin watched as, slowly and carefully Pedro painted four brown spots; then the pony's eye.

"You paint a lot better than I do, Pedro," Robin said.

Pedro looked pleased. But he said nothing as, his head on one side, he looked at the pony.

Robin looked at him. "If this wasn't a new painting book I'd gotten for my birthday—" it sound ed as if he were talking to himself.

"Pedro, we go," Juan put in his head at the patio door.

With a little sigh Pedro put down the paintbrush. "Adios—good-by, he said. "Thank you for the painting."

He started toward the door, but suddenly he turned back. Bending over the painting book, for a long minutes he looked at the pony with the red halter and the brown spots. Then, turning, he ran out of the room

But Robin had seen the look on his face.

Robin watched Pedro climb up on the seat of the wagon. Juan got down to fix the rein on one of the burros. Pedro sat there, hunched up under his big hat, staring straight in front of him.

Perhaps next Christmas—" Robin told himself. He broke off. It was a long time until next Christmas. Juan was up on the wagon now.

"Creak — creak!" began the the wheels.

"Next Christmas" Again Robin remembered the look on Pedro's face. "Wait!"

Juan looked over his shoulder at the call from the door.

"Wait!" Robin told him again. The next minute he was back in the house, busily gathering up some things from the table.

After Pedro and his father had gone, Robin sat rocking in front of the fire. Two of the logs Juan and Pedro had brought were already making a fine bright flame. He could never finish painting the spotted pony picture, now, but as he wached the flames he seemed to see in them another picture. It was a picure of a wagon drawn by two burros. On the seat were two figures, one larg, one very small, both in big hats. The small one was tightly holding a flat package.

It grew darker outside and a nice smell of hot gingerbread drifted in from the kitchen. Robin sat watching the picure in the flames. He sort of liked it, he thought.

—Storytime

Letters Count

Have you ever considered the influence of letters? Sometimes we write them so glibly. Yet they reveal our characters and can have great outreach in "winning friends and influencing people."

A noted surgeon and scientist, who is frequently asked to address young people, was greatly influenced by a letter when he was a mere lad. A letter from a young railroad clerk was responsible for his becoming an earnest Christian. Since then, in the course of his long life, he has published more than thirty volumes of religious themes, for many years edited a Christian paper which had a circulation of more than a hundred thousand weekly, addressed large assemblies of Christian workers, and is probably the most effective personal worker of this generation. All of this service is traceable to a letter that was prayed over by the writer.

„This past year, we have been writing to three young men of promise. In our letters we have tried to reveal the joy of Christian service. Imagine the satisfaction which has been ours recently to have had letters from all three stating that they are dedicating their lives to God's work. Indeed, evangelism can be done through letters. Why not use them?

—Evangelical Crusader.

When bad men combine, the good must associate; else they will fall, one by one, an unpitied sacrifice in a contemptible struggle

If you want to get a good general view of a man's character, find out from him what his opinion of his neighbor is.

First President

The late R. H. BOYD, founder of the National Baptist Publishing Board and builder of the National Baptist Publishing Board Plant, recognized as the premier member of the fourth estate in publishing and distributing Baptist literature. He was the first President of the Citizens Savings Bank and Trust Company.

First Cashier

The late J. C NAPIER, the first Cashier of the Citizens Savings Bank and Trust Company. He was an Attorney-at-law, by profession and was former Registrar of United States Treasury and had been twice chosen as presidential elector and served for many years as a member of the State Executive Committee of the Republican party in Tennessee, and was a former President of the National Negro Business League.

First Chairman

The late PRESTON TAYLOR, first Chairman of the Executive Committee. He was the owner and senior member of Taylor and Company Undertakers, he purchased Greenwood Cemetery, the largest of its kind in the United States, and he also built Greenwood Park, a large recreational center. He was organizer and builder of the Lea Avenue Christian Church and was President of the National Convention of Christian Church workers.

We Will Honor The Intrepid Three

A Trio of Nashville Men Who Accomplished Things in Life—Whose Memory We All Cherish

The Citizens Savings Bank and Trust Company, located at Fourth Avenue, North and Charlotte Avenue (formerly Cedar Street), invites the people of this city, this state and nation to join in with them in honoring the late Richard Henry Boyd, the first President of the Citizens Savings Bank and Trust Company, the late Preston Taylor, the first Chair man of the Executive Committee and Board of Directors, and the late J. C. Napier, the first Cashier. This is the oldest bank of its kind in the United States and for the next three months the depositors, stockholders, directors, Executive Committee and officers will be conducting a "Deposit Shower Campaign" to honor these three stalwarts as we approach our forty-fifth birthday. Everybody can join in this movement, little or big, young or old, male and female of every walk of life, regardless of race, creed or color, in opening a savings account in this the Citizens Savings Bank and Trust Company of Nashville.

These three men had faith in God and confidence in themselves and the people. Their foresight and courage, their indomitable will-power, their interest in humanity never wavered. If obstacles arose in their path they either went over them, around them or through them. Nothing ever stopped them but death itself, but their spirit still lives and the institution they founded is growing. Because of these virtues, these accomplishments and this record that has seldom been reached and never surpassed, we feel that the people of America would like to honor them with a deposit during the "Deposit Shower Campaign" in the bank that they felt was destined to give recognition not only to our generation but to unborn generations. You can deposit by mail, if you are not living in Nashivlle by sending a money order to the "Banking by Mail Department" of the Citizens Savings Bank and Trust Company, Nashville, Tenn. As little as ten dollars will open a savings account in this bank, after which we will send you a Signature Card and your Savings bank pass-book.

Remember that for three months this "Deposit Shower Campaign," honoring the found er and the first major officers and early stockholders of this Bank, will continue and that you may join in with us in giving them honor.

CITIZENS SAVINGS BANK & TRUST COMPANY

We are members of the Federal Deposit Insurance Corporation—You can make your Deposit by Mail—Capital stock $100,000.00 Surplus $42,000.00. Resources over $1,600,000.00.

We Can Win

This country will win the war against fire when, and only when, we realize that every American must take his place as a belligerent.

Those whose main business is fire prevention are doing a fine job. They are helping to develop safer building materials, appliances and machinery. They are improving our fire departments and other fire fighting facilities. They are making available a wealth of material which shows the causes of fire, the principal hazards, and proven means of prevention. But all this essential work will be done in vain unless a wide degree of public interest and cooperation are obtained.

There is nothing impersonal about fire prevention. It has only one purpose—to make your home, your property, and your person safe from one of the cruelest killers and destroyers. Its sole aim is to save the $700,000,000 worth of property and the more than 10,000 lives that fire now consumes each year. Its goal, therefore, is to make this a safer, happier and richer country.

Organized fire prevention work is being brought to a peak of activity in 1949, and it will reach its apex Fire Prevention Week next October. The leaders and experts are showing the way. It is up to the rest of us—the millions who are never safe from the threat of fire, whether we realize it or not—to make this great work bear its full fruit.

Southern Advisory Committee the Christian Rural Overseas Program

How We Bathe

By Eleanor Hammond

Raindrops wash the flowers faces-
Mother Wind then wipes them dry.
Mother Cat combs every kitten,
And they do not whine and cry.

Frogs and fish are always bathing.
Birds must bathe as well as fly—
I am glad of soap and water,
And soft towels to make me dry!

Bees can distinguish between different degrees of brightness of a given color, but are blind to red.

USO Re-activated

Standard News Syndicate Issues Release For Publication

Back in 1941 the USO responded promptly and effectively when the nation's Armed Forces of all races called for civilian assistance to provide for the recreational, spiritual, welfare and educational needs of the men and women in uniform.

At the peak of its war-time career, the USO conducted 3,035 operations, exclusive of USO camp shows whose curtain rose 700 times a day on performances in every corner of the world, entertaining armed servicemen, regardless of race or color. Throughout the terrible days of total war a million and a half civilian volunteers performed myriad important tasks. They continued to serve until they were no longer needed. Even then, the USO stayed on the job to give a friendly lift to returning personnel, scattered families and hospitalized veterans.

Now with the expansion of our peace-time military establishment, a new USO is being organized for active duty in 1949. It has a big job ahead, and while its problems now are perhaps not so numerous as before, they are equally as important and deeply rooted. The peace-time army will be very young, comprising mostly boys in their teens and early twenties.

With the new USO at their side, these boys will have someone to talk to about their dreams and hopes. They will be able to enjoy dances, games, sports — the many items that contribute home-like customs and comforts.

To enable the home folks to help assure USO services for the young new armed forces, the new USO is included among the Red Feather services for which Community Chest campaigns in many cities ask public support this Fall. When you give, remember to give enough for all these services which are important factors in the welfare of every community, plus the USO

The Chest way is the best way! Give today for support of all Red Feather services — plus USO— through your local Community Chest.

Remember the Red Feather services of your home town! Give now to support all Red Feather services—plus the USO— through your local Community Chest.

The Red Feather means many campaigns in one. Make a single pledge for all Red Feather services—plus the USO— through your local Community Chest.

SERVES SERVICEMEN

Got somebody in the family in service? You can give him the comforts of home by giving through your Community Chest to the new USO. With its many friendly services to the serviceman, USO now is a Red Feather service, too. Give through the Community Chest.

SERVES YOUR SONS

The needs of the new servicemen must be met! That's why USO, at the time the Department for Defense, has been reactivated. The new USO serves your sons—and needs your support. Give enough for all your Red Feather services, including USO, through the Community Chest.

"But why tie USO in with the Red Feather? The USO doesn't belong to any one town."

"That's right," said the Red Feather. "I belongs to no town—and to every town in the USA. These kids in uniform will belong to a thousand homevilles —and wherever they go there'll be a USO near by—compliments of the folks back home."

Left-over chicken will go a long way if diced and added to a mixture of rice and tomato sauce. Bake in a casserole topped with buttered crumbs, or heat on top

One Thousand Attended Rally Opening NCNW's Yearly Convention

Washington, Oct. 10—Necessity of more social education for children of all races was emphasized today at the mass civil rights rally of the National Council of Negro Women at the Commerce Department auditorium.

One thousand women from every section of the United States and Canada attended the rally which opened the Council's 13th annual convention in Washington.

Mrs. Sadie T. M. Alexander, attorney and member of President Truman's Committee on Civil Rights told the delegates that she would "sacrifice everything . . . for the freedom of Negro children in generations to come."

Equal education, beginning in kindergarten and the early grades is the easiest way of improving the Negro race and the country in general, she said.

She expressed the opinion that the American people face an era of purges and "Gestapo restrictions" unless they immediately narrow the gap between what we preach and what we practice."

She pointed out that our Constitution and Federal laws provide equal opportunities—both education and employment—for all people, but that in many sections of the country this tradition is not practiced.

Mrs. Alexander was followed on the program by Dr. Ethel J. Alpenfels, associate professor of education at New York University, who has recently completed a Nation-wide study of social education in public schools.

Dr. Alpenfels urged that children be taught early in their lives human relationships between nationalities and races. Education—and particularly education at a very early age—is the surest way of combating group inequality and prejudice, she continued.

Mrs. Mary McLeo Bethune, founder and president of the N. C. N. W., made the welcoming address and presided at the meeting. Mrs. Julia West Hamilton, President of the Phyllis Wheatley Y. W. C. A., gave the invocation, and Emmer Lancaster of the Commerce Department and Dr. Charlotte Hawkins Brown, President of the Palmer Memorial Institute offered greetings to the rally's opening.

Mary Caldwell Dawson, founder and president of the National Negro Opera Company, sang two operatic selections with accompaniment by John R. Hoskins. Helen Mayle of the department of fine arts in religion of Howard University, also sang. Her accompanist was Ethel Ramos Harris.

Mrs. Muriel Johnson, chairman of the program committee, introduced the special guests who included Mrs. Olga Margolin, representing the National Council of Jewish Women; Miss Elizabeth Christman, executive secretary of The Women's Trade Union League, and Georgia Ellis Jones, a Chicago, Ill., attorney.

At the close of the program, Miss Mary Church Terrell, prominent Negro educational and civic leader presented the council with an oil painting of its president, Mrs. Bethune, painted by William Sylvester Carter.

One World' Concert Sponsored by N. C. N. W. in Washington

Washington, Oct. 12—Representatives of some 40 foreign conutries tonight participated in a "One World Concert," sponsored by the National Council of Negro Women in the Interdepartmental Auditorium of the Labor Department. The colorful program, featuring native music and folk dances, was one of the high spots in he council's thirteenth annual conference which opened here last Sunday and will conclude tonight.

Throughout the four-day conclave "World Citizenship Through Human Understanding" has been spotlighted by the some 1,000 delegates. Last night's musical program was in keeping with the orgonization's theme.

Greatest Story Ever Told

American Broadcasting Company's New Recordings

New York, N. Y.—Through the kindness of a listener of "The Greatest Story Ever Told," the public library in Waterville, Maine, has been given a complete set of the recordings of this outstanding radio program so that they may be available to any group in the community which would like to play them at any time. The listener, in the true spirit of the program, preferred to remain anonymous, thereby emulating the sponsor of the program who has refrained from using it for any advertising purposes, but keeps it entirely a public service presentation.

The recordings of "The Greatest Story Ever Told," heard Sundays at 6:30 p. m., EST, over the ABC network, are available at cost in albums which contain two programs each. This low price is possible only because musicians, actors, and all those connected with the production of it were willing to forego the usual compensation for recordings. Schools, churches, hospitals, and other religious and civic groups have used them as part of their own activities, for study groups, and in other ways. The recordings are available through the American Broadcasting Company, Recording Division, Radio City, New York, N. Y., at $4.95 per album.

The twenty-one albums that have been recorded so far were accepted for the Waterville Public Library by Dean Ernest C. Marriner, Vice President of the Library Trustees, in a broadcast ceremony over Station WTVL. In accepting the gift, Dean Marriner expressed his gratitude for such a fine, significant gift.

The Mantle Is Cast Upon You

Carry on! Henry Allen Boyd, the noble work begun
The mantle was cast upon you by the Saint, R. H. Boyd,
The work of giving to the world the message of God's word.

The task that's set before you, a grand and noble work,
Your heart, your hands shall He give strength to carry on for God.
The obstacles will cloud your path. the storms may raging come
The still small voice will ever say, the work is God's go on.

There is no fear, there is no laek, to carry on for God,
For He who to the task hath called thee, will give strength to carry on.
Then carry on! Henry Allen Boyd, the work of God begun,
The race is on, the battle raging, a victory awaits the goal;
A life, a light, a beaten path, a crown, all for work well done.

I first saw star shadows when I was a boy, tramping down a lonely country road after a new snowfall. It was cold and still and brilliantly clear. The stars swung like great lamps in the sky and snapped when I looked at them. A great star burned in the west, and suddenly as I passed a row of tall maples lining the west side of the road, I detected on the snow ahead some faint yet distinct bars of shadow. Each bar came from the base of a maple tree — they were shadows cast on the light of that star! To this day I can recall the strange thrill that went over me then. — Walter Prichard Eaton. NEW ENGLAND VISTA (Wilde).

It is an undeniable fact that, if a fox terrier two feet long, with a tail an inch and a half high, can dig a hole three feet deep in

"Render Unto Caesar"

By Maeanna Cheserton-Mangle

The Church has been called the "mystical home of man." It has been looked upon as a place of spiritual rearing—a place "apart" from the world. This principle Jesus made plain centuries ago on that last night in the Garden when He prayed for His Disciples. "I am no more in the world but these are in the world and I am glorified in them. . . . They are not **of** this world even as I am not **of** this world, but thou didst send me into the world, even so send I **them** into the world."

Are we **in** or **of** this world? This month we are given a chance to say. As adult members of a democracy, we are given the right of franchise. If we do not exercise this right we are neither **in** nor **of** this world. If Jesus were here today would He vote at the polls? Would He let His voice be heard in politics? From His actions in Galilee, yes! He spoke to the scribes and the Pharisees in no uncertain terms as He demonstrated their hypocrisy and deceit. He flogged the money-changers in the temple. He answered those who would trip Him concerning the law. "Render unto Caesar, "He said, "the things that are Caesar's, and unto God the things that are God's"

Would Jesus vote today, Yes. He would "render unto Caesar" the benefit of His voice in the running of the government. He would "render unto Caesar" taxes for the running of the government. He would "render unto Caesar" His interest and support as a citizen. In a word, He would BE a citizen.

Citizenship is a two-way affair. A government owes its people nothing that they do not make possible. Democracy is a government **of** the people. To vote is good democracy. Jesus sent US INTO the world. To vote is good Christianity.

—Religious Press Committee.

Passion For Souls

When Charles G. Finney was a lawyer twenty-nine years of age, he examined the claims of Christianity by a profound study of the Bible. His surrender to Christ followed and was so complete that he determined to abandon the practice of law that he might persuade others to accept his new-found Saviour. The Bible was his guide. Studying this Book with his keen and finely trained mind, he developed his own theology. As an evangelist, he swept over the land, preaching the unsearchable riches of Christ. Indifference to his own interests, a great passion for souls, an earnestness that aroused audiences to a white heat of emotion, a flawless and irresistible logic, and a tremendous insistence that those who accepted Christ should live within his will characterized his ministry. Friends in New York organized the Broadway Tabernacle Congregational church. Here he preached with great passion, making the church the center of a far-reaching evangelical work. While Dr. Finney was in New York, Oberlin College was started to prepare men of his type for the ministry. In the work of this college wa san irresistible call to the man who was at once an evangelist, philosopher, and theologian. At Oberlin, as professor and president, he did the great work of his life. Students from all over the land flocked to this institution. While Finney taught the profoundest subjects in the college and in all the surrounding country, he continued to manifest his passion for souls as he preached the gospel that saves the lost and keeps the saved. Would not college presidents with this passion for souls be a blessing to our generation.

10 minutes, to dig the Panama Canal in a single year would require only one fox terrier 15 miles long, with a tail a mile and a half high. This is statictically true; yet one must seriously consider whether, after finding the fox terrier, one could make it mind.—BURGES JOHNSON.

". . . . Unto Others

By Maeanna Cheserton-Mangle

The Gospel remains alive and meaningful, continually charged with appeal and force, only as we live it and work to advance its message to the world. There can be no convincing preachment to the non-Christian people's of the world, without corresponding action to make such preachments a real and vital part of our everyday ways.

The teachings of the Gospel concerning the brotherhood of man leaves us no alternative. We must consider the man on the street our brother. Likewise he who attends the community meeting, political party, trade union, local government and Chamber of Commerce. As more and more Christians fulfill that role, we lend strength to our beliefs.

Our duty in behalf of our brothers across the world is two-fold. In America, through a series of revisions in our stand on civil rights, we enjoy the greatest amount of freedom on the face of the earth. By virtue of this, the eyes of the world are upon us. As we stand or fall in upholding these laws of freedom in our country, we shall affect the laws and lives of those of other countries.

Recently the citizens of Montclair, New Jersey decided to do something about their situation. They wondered how they measured up and decided to find out by making an audit of their assets and liabilities in the field of civil rights.

First came employment. On the asset side, Montclair learned that its local government did not base its hiring policy on race, creed or color. Still, it was admitted that of a 70-man police force, only 4 members were Negroes; while there were no Negro firemen at all. In private employment, major companies like Prudential Insurance, Westinghouse Electric, Sears-Roebuck, Bell Telephone, rated a clean bile of health. But it was equally true that Negroes could find few private jobs save as manual laborers.

The housing picture was nasty. The local veterans' temporary project ran as it should, with no discrimination; but the real estate operators quietly practiced the starkest sort of discrimination. Of 170 deeds examined, 40 embodied restrictions prohibiting the sale, lease or gift of property to certain racial or religious groups.

On they went with their investigation: recreation, schools, health, eating places, et cetera, until an impressive amount of information had been gathered.

What was the value of all this data? To begin with, it was a wonderful example of pratical Christian awareness of others. Instead of leaving it up to the next fellow, Montclair's citizens took an active part in making brotherhood meaningful, in bringing human rights within the reach of all. Once the Audit was finished, Montclair knew where it stood, where the record was straight and proud, and where it was weak. It knew where vigorous action in support of Americanism and Christianity was needed. And it is safe to predict that, having discovered its own shortcomings, Montclair will be all the more cager to take swift remedial action.

Montclair is only one of many bright spots on the human rights horizon. For two years, the State of New York has barred discrimination in employment. Contrary to the hackneyed verdict of wiseacres that "you can't legislate discrimination out of existence," the New York State fair employment law has been remarbably effective in doing just that. To recalcitrants, the New York State Committee Against Discrimination (SCAD, for short) points out the benefits of fair employment policies; where necessary it marshals public opinion to reinforce its reasoning. SCAD has always won out with these methods; never once has an employer or a labor union resisted to the point where punitive measures had to be invoked. The law is rightly viewed as the friend of man.

America does not lack for other tangible expressions of her interest in her brothers. The Church is making her influence felt in the council halls of the United Nations, where a Convention Against Genocide, designed to ban wholesale assaults against racial, religious, cultural or national groups shorty will come up for adoption. Perhaps the most mouentous united action on the part of the Church has been its efforts on behalf of the International Bill of Human Rights, also before the U. N.

Just before the San Francisco Conference, God-fearing people agitated for a Charter on Human Rights. By dint of an enlightened public, it was possible to include in this charter articles on racial and religious freedom such as are theoretically in our own United States Declaration of Independence and subsequent Bill of Rights. Progress has been made since then in the halls of the United Nations. Now the Declaration on Human Rights is complete, and covers at least all the essential aspects of religious freedom. These essential aspects, however, constitute only a minimum of the practices that have been tested by experience and agreed to be basically necessary for the observance of religious freedom. The Declaration is a big step in the right direction but it is by no means a legal document which would actually guarantee the rights and freedoms within individual countries. It has, however, a decided educational value which may in time acquire some legal significance.

Now is the time for all who are concerned about the International Bill of Rights, to make their voices heard. We, of the Church, should now press for a Covenant where these rights may be more exactly defined, and which will more definitely commit the governments of the world by ratification on their part in accordance with their individual onstitutions. This can be acomplished only through us.

We ask: What can we do: How can we, in remote localities, make ourselves helpful to so widespread an enterprise. There is none on the face of the earth who has a greater implement for good in his hand than the boy, girl, man and woman of the Church. Here we have a center, a means of communication, a place for education, a place for dedication and prayer. All these we can use to the furtherance of this phase of God's will for us. We can gather together people of like interests. Them we can agitate and educate. With them we can dedicate ourselves to a more vital Christian way of life. We can pray and work to the end that our representatives in high places will be properly commissioned to prepare and vote for the Declaration on Human Rights and a Covenant to make them vitally effective throughout the world.

Yes, we are singularly blessed in the freedom we have and in the oportunities that are ours to share this freedom. Our Master, in speaking of stewardship said "Unto whomsoever much is given, of him shall be much required: and to whom men have committed much, of him they will ask more." We have a great heritage. Much has been committed to us. Much will be required of us. This may be the "much".

Let none of us who bears the name of Christ, rest until we have done what the Lord would have us do ". . . unto others."

—RELIGIOUS PRESS COMMITTEE.

O SOLE MIO

A certain Welshman, the proud possessor of a very fine bass voice, confided one day to a friend that he had had a remarkable dream. "I was in a mighty choir: 5000 sopranos, 5000 altos. 5000 tenors—all singing at once, double forte. Oh, magnificent! But suddenly," continued the singer, "the conductor stopped the lot, and turning to me said, 'Not quite so loud in the bass, Mr. Jones.'" — WALL STREET JOURNAL.

"Follow The Lord" In Soul-Winning

One day Jesus called seventy men to him, divided them into pairs, and sent them out as his advance agents into areas "whither he himself would come." Sometime later the men returned with joy, saying that even the demons were subject unto them. This magnificent visitation campaign took place nearly two thousand years ago, but on through the years since that time God's people have found that when they team up and take the gospel to the lost, the power of God is upon them. And it is still gloriously true in this year of our Lord, 1948!

Some months ago a thirteen-year-old boy accepted Christ. Soon afterward, two men went to see he boy's lost father. They found him alsos smug in attitude He said he was all right as he was

The two men, in a manner that was in no wise apologetic, forcefully confronted the man with truths of the Bible concerning sin and death and hell, the Saviour and salvation, repentance and faith, heaven and everlasting life. They had a prayer and left. Seemingly they had made little impression on the man.

Then two weeks later the man walked down the aisle of the Baptist church, coming in the spirit of a little child to take Jesus as his Saviour. God's Word had struck home! Two men had gone visiting.

Jesus has all the power today that he has ever had. He is as willing and as anxious to manifest that power today as he ever was. His blessed promise, "Lo, I am with you alway," is literally and faithfully kept today to all those who go out at his command to do his will.

Many Christians have yet to discover that God stands ready to bless the efforts of any child of his who is willing to do the specific things that he has commanded. The blessings of God are not alone for the preacher or for the layman with particular abilities and specialized training. The blessings of God are upon all those who will do his will. Take the case of Elmer.

During a revival in a town in western Arkansas, perhaps half of the members of the Baptist church were praying for Sammy. Sammy had been running away from the Lord for about thirty years, but one day two men cornered him and pressed the claims of Christ upon him. However, Sammy did not yield that day. It took Elmer to win Sammy.

Elmer was only three days old as a Christian when he asked the same two men to go with him to see Sammy. They went. Seated in Sammy's living room, Elmer spoke words about like these: "Sammy. I don't know a lot to say, but I want you to know I was just like you until thrree days ago. Jesus saved me then. And Sammy, he will will do the same for you if you'll let him do it." The men had a prayer. After the prayer Sammy yielded to the Saviour. God had blessed again the going, witnessing, and praying of his people!

A woman wearing an off-the-face hat she had just bought asked her cook how she liked it.

"It's a right pretty hat," the cook gave judgment. "But it suah do make yo' face public."

Old News, Good News, New News

Archer Wallace

In the fall of 1942 the explorer Stefansson wrote what is perhaps the most comprehensive study of Greenland. He says that Christianity came to that country probably in the ninth and tenth centuries, and then as a result of persecution and hard living conditions it was seemingly stamped out. Greenland came once more to the attention of Christian teachers, about two centuries ago and a work of God was established which has grown into a strong church. It is interesting to recall, however, what the first Eskimos of that bleak northern land said when they heard the story of God's great love which we have in this lesson. It was something of a rebuke, "If God loves us so much, why have you been so long in coming?"

In the memoirs of the poet Alfred Tennyson, he tells of staying with two humble Christians in their village home. When he arrived he asked if they had any news. "There is only one piece of important news." said the woman, "and that is, Christ died for all men." The answer delighted the poet. He said:."That is old news and good news and new news." It was of this glad message that Horatius Bonar wrote:

Thy love to me, O God
Not mine, O Lord, to thee,
Can rid me of this dark unrest,
And set my spirit free.

Of National Council Of Negro Women Reports

Washington, D. C.—The findings and recommendations of the 13th Annual Convention of the National Council of Negro Women representing a membership of 850,000, recently concluded here, were announced today by Mrs. Mary McLeod Bethune its Founder-President.

She also reported unanimous adoption of a resolution commending President Harry S. Truman for his support of full civil rights for all citizens, regardless or race, creed or national origin.

Unanimously adopted also was a resolution introduced by the Council's International Commitee vigorously urging that the United Naions not take any action which would result in the African Colonies and people being placed either under Italian Trusteeship or being returned to Italy Sovereignty

The recommendaions are as follows:

1. Human Rights—

The Council pledged its support to the United Nations in is efforts to secure both a declaration of human righs and a covenant of human rights, and pledged its membership to work for their ratification when presented to he U. S. Government.

2. Civil Rights—

The Council pledged itself anew to work increasingly for:

The abolition of lynching.

The replacement of mob rule with equal protection of all citizens under law and order in a free society.

The abolition of segregation and discrimination in the armed forces.

The elimination of the poll tax and other similar devices as prerequisite for voting.

The writing of the principle of fair practice in employment into a national law with adequate sanctions.

It deplored the "flagrant examples of discriminatory practices" existing in the Nation's Capital which should be an example of the Democratic way of life.

3. Employment:

Endirsed enactment of labor extension service law for the training of wage and salary workers at state universities and reaffirmed legislation designed to improve its support of organized labor and the welfare of labor.

4. Housing—

Membership of the Council will work for enactment by the 87th Congress of the public and rural housing provisions of the Taft-Ellender-Wagner ill and for the elimination of racially discriminatory practices by real estate operators, builders and mortgage-lending institutions.

5. Health—

Will work in cooperation with pub lic and voluntary agencies at community, state and national levels for the development of adequate health services for all citizens. The NCNW strongly endorsed the national health insurance plan.

6. Education—

The Council will call upon the 81st Congress to pass legislation providing Federal aid to education prohibiting discrimination and segregation in the educational system.

7. Youth Conservation—

As an aid in the fight against juvenile delinquency, NCNW will undertake the organization of girls and young women between the ages of 16-21 as "Junior Councilors."

8. Citizenship—

Emphasized the importance of women exercising their right to vote in order to elect candidates who are sympathetic to a program for the furtherance of civil and human rights for all.

In announcing the results of the Convention, Mrs. Bethune said, "I am greatly encouraged by the fact that women across the counry very definitely have a growing understanding of the vital importance of unity. That was forcefully conveyed to me at every session of the Convention. I sensed an appreciation of the efforts put forth by the Council for 13 years emphasizing the power of unity of purpose and unity of action."

Yesterday's Children

Louisa May Alcott
Evelyn L. Nelson

For every child invited to Louisa May Alcott's birthday party the most important moment had arrived—refreshment time! A four-year-old child, wearing a lovely crown of flowers, stood on a table, making-believing that it was a throne. Louisa, of course.

Around and around the table the laughing guests marched. This was Louisa's cue to give each child a piece of birthday cake.

Just as the last guest was about to be served, the make-beileve queen saw that a mistake had been made in counting. Only one piece of cake remained on the plate.

Great was the temptation at that particular moment in the life of Louisa May Alcott. What should she do? Who should eat that last piece?

Mrs. Alcott could do nothing about the mistake now. But she whispered, "I know my Lou-y will not let a little friend go without."

Mother was right, and the make-believe queen learned something about the meaning of the word, self-denial.

Nor did the child forget the time, two years later, when she found out that running away from home was no fun at all

It was after dusk that the bell kept ringing and ringing. The bell was rung for Louisa's benefit. Where was she at that very moment? She was in the Land of Nod but not resting on her little bed at home. Her head rested against the pillow-like body of a friendly dog. Both, the child and the dog slept on a doorstep.

"Little child lost. Six years old. Wears a pink dress, white hat, and new green shoes!" That was the Boston's town-crier.

Louisa awoke with a start. How happy she was to be found, for she had wandered far!

By the time she was eight, Louisa was writing verses to the robin in her own back yard. After a time she started writing stories. But it was not until she was in her middle thirties that someone asked her to write the story of her own happy childhood and early life. She followed the friend's suggestion and out of it came—Little Women!

Immortal Lady

Frederick Norman Joy

The old soldier walked with the aid of a cane across the small living room of his humble cottage; stopped before a picture that hung above the open fireplace, stood at attention, then saluted. The picture was not that of a king, President, or emperor; not that of a famous navel captain or military leader; no, it was the picture of a woman.

This incident, although it happened over forty years ago, has like so many things experienced during early childhood, remained a vivid memory. The soldier was my great-uncle who served with the British army through the Crimean War; and the picture was of the immortal lady—Florence Nightingale.

Florence Nnghingale was born May 20, 1820 in Florence, Italy, while her parents were making an extended tour of Europe.

Returning to England they purchased a home near Romsey, and here the young Florence spent her early childhood. She was a sensitive child, shy, retiring, deeply religious and very fond of birds, flowers, and the smaller animals. At seventeen she was taken abroad for the first time; her parents were, by the standard of that time, fairly wealthy people. It was during this visit to continental Europe that she became interested in social conditions, and spent much time studying the methods employed in the various social institutions.

Returning to her home in England she became obsessed with the idea of devoting her life to the help and comforting of suffering mankind. Asked why she did not write something in keeping with her attitude toward social conditions, she replied, "Feelings are wasted in words, action brings results." From that time until her death in 1910, that was her creed; action will get results.

Contacts with the great philanthropist Lord Shafetsbury, induced her to devote time inspecting the London hospitals and ragged schools. Homes for orphan and destitute children were known as "ragged schools" in those days. With the experience gained in this work, her idea of caring for the sick became more intense.

The nursing profession in the early 1800's was of a very low standard, and attracted only the very commonest of women. It was estimated that over 80 per cent of the nurses in London at that time were addicted to the excessive use of strong drink. They were dirty in their person, and the methods of caring for the sick. Washing a patient was to them nothing short of madness; and in most cases, especially among the poorer classes, bed colthes were never changed until they became so thikly infested with vermin that it was necessary to destroy them.

It may readily be seen that nursing was not particularly inviting to a lady of wealth and refinement such as Florence Nightingale. Her parents and friends, while admiring her thought of others, tried very hard to influence her in her chosen course of action. They explained to her the type of woman and the conditions in which she would come in daily contact.

However this did not deter her. Florene Nightingale was made of sterner stuff. Whatever she did or was able to accomplish she felt that it was not enough.

In 1850 during a trip to Greece, she spent a great deal of time at a school and orphanage in Athens which was conducted by two American missionaries and a Greek school mistress. Elizabeth Kontaxaki. Concerning them, Florence Nightingale said: "How useless my life seems to be by the side of these two women."

After the Battle of the Alma, one of the major engagements of the Crimean War. a correspondent of the London Times reported of the gross neglect of the wounded. As a result of these news stories public opinion was aroused and a campaign was started to raise a public fund, which was to help alleviate as much as possible the suffering of the sick and wounded.

Protests were made to the government, and there was much shifting of responsibility from one department to another. Finally public opinion became so intense that the War Office took steps, and Florence Nightingale was approached with the idea of leading a group of nurses into the Crimea.

After much delay caused by the inevitable red tape, arrangements were made for the first group to leave England. There were thirty-eight in the first contingent, and in keeping with the nurses of that day, most of them a lower type of woman. Of this thirty-eight, only one wished to do good, the others had volunteered because of money inducements.

They reached Constantinople November 4, 1854, the same day that the wounded arrived there after the Charge of the Light Brigade. At that time there were only two hospitals in which to accommodate the wounded, both in Scutari, the general hospital, and the Barrack Hospital. The Barrack Hospital was the old Turkish military barracks. transformed by giving it a coat of whitewash.

With two thousand sick and wounded in the hospitals, she was called upon to get the most efficiency from her small group of nurses. This she was able to do by the enforcement of a sympathetic but stern code. Primarily it was this: effective care. true kindness. kindness in conciliating opposition, strit methods, stern discipline, and rigid subordination.

Florence Nightingale was never critized for laxity, only for alleged too rigid discipline.

In addition to the difficulty of installing some orderly system in the hospitals. she found two extremely hard problems to overcome: medical jealousy and military prejudice. Although she was directly responsible to the War Office, correspondence between the battlefield and London took too long, so that any problem involving this jealousy and prejudice she had to solve for herself.

Among the many things that high-ranking military officers opposed was the use of ambulances for the transportation of the sick and wounded, and the use of orderlies to scrub the hospital floors.

The principal diet of the wounded was boiled meat; and many died either because they were not able to feed themselves or were too sick to eat the meat. Her first step was toprepare special diets for the more serious cases, cooking the foods over stoves that she had purchased in Marseille on the way out.

Some Fallicies That Must Go

1. WHITE SUPREMACY—Thruout the ages, the question of the supremacy of the races has played an important part in the history of mankind. This subject caused the Germans to be in the position they are in at present. It is causing this country much embarrassment in international affairs. The President of the United States is now a hated man in the Southern section of this country because he dared call for a program that would guarantee all citizens their rights under the constitution.

2. IGNORANCE AND SUPERSTITION—Unrest prevails through out the world. Man has not reach reached that place in life in which he can have confidence in his fellowman. This condition exists because of ignorance and superstition. A new type of education is necessary. An education for peace built upon the principles as practiced by our Savior. "If I be lifted up, I'll draw all men unto me."

NEW IDEALS

A new world is coming. Prepare to meet the challenge. The time will come when men will be too big to think in terms of race or creed. Only man's ability to produce will be the crying need. My grandmother was a pioneer teacher. She used to say to me: "Son, I want you to like white people." Years later I am a teacher, but I admonish my readers to be men and women. The world is sadly in need of men and women and if you are to play your part well in the new world, always remember that:

1. Love is a great motive
2. Faith and hard work built America, they will build a new world
3. Education must have moral content
4. Chance favors the mind that is prepared
5. Set high standards for yourself
6. Remember, that any way of life based on force will sooner or later disappear
7. Threats never pay: Weakness is foolish to use it, Strength need not
8. Let your life be of such nature that you lift rather than lower the standards of your community.

The Power of Thought

Twenty-five years ago, a French psychologist by the name of Coue became famous for his book and lectures on the power of the subconscious mind, consciously directed, to remake any individual.

He used to illustrate his ideas by this interesting proposition. Place a four inch plank across the floor of a room, and any man can walk along it without any difficulty whatever. But place the same plank above the street from the tops of the town's two highest buildings, and hardly a man can be found who can walk across it.

What is the difference? The plank is the same, the muscles are the same, the mind is the same, the will is the same. The difference is that when the plank is on the floor, we are thinking only of walking across. When the plank is suspended in air, we are thinking more about falling.—Christian Observer.

NAACP Blasts Thurmond For Breach of Courtesy

Columbia, S. C., Oct. 28—The National Association for the Advancement of Colored People this week assailed Gov. J. Strom Thurmond, Dixiecrat standard-bearer, for ostentatiously withdrawing his invitation to Gov. William H. Hastie of the Virgin Islands to visit the Governor's Mansion here. This action was branded "a breach of even common courtesy." Stating that he did not know Gov. Hastie was a Negro, Gov. Thurmond asserted that the invitation was "a mistake."

In a letter rebuking Thurmond for his action, Rev. J. M. Hinton. president of the South Carolina state conference of NAACP branches, declared, "The statement attributed to you in newspapers today concerning Hon. Governor Hastie of the Virgin Island, if true, is a breach of even common courtesy due any official of the United States Government. You would not have been honoring Governor Hastie but the United States government that he represents . . . The mansion does not belong to you, but to the taxpayers of the state."

Earlies this week, Walter White, executive secretary of the NAACP returning from Paris after serving as a consultant to the UN General Assembly, denounced the States' Rights Party for its "blistering diatribes continually leveled against the civil rights program" Calling the Dixiecrats battle to "defend the Constitution" merely an excuse for prolonging the life of Jim Crow, Mr. White declared: "With incredible bluster the States' Rights party is telling the rest of America that so far as the South they represent is concerned, nothing matters except their right to continue lynching, disenfranchisement, and segregation."

TO HONOR WALTER WHITE

New York, Oct. 28—Walter White, executive secretary of the National Association for the Advancement of Colored People, will be a guest of honor at the Book and Author Luncheon to be held by the American Booksellers Association and the New York **Herald Tribune** on November 23 at the Hotel Waldorf-Astoria. Mr. White's autobiography, "A Man Called White," published by Viking three weeks ago, has gone into its third printing.

Sam—Good Boy or Bad?

Sam was always getting into mischief. He was so full of life that there was never enough for him to do, but this did not bother him much. He was good at thinking of things.

"Sam is the worst boy in this class," the children said.

Miss Ellen did not think so. She liked Sam, and Sam liked her.

One Sunday the lesson was about doing things for others.

"We're always talking about doing things, but we never do them," said Sam. "I get tired of doing nothing all the time."

"We're s'posed to do things at home, not at Sunday school," said Sue, scornfully.

"We could plan something to do at Sunday school and do it during the week," said Miss Ellen. "That would be better than doing nothing."

"I'll say it would," answered Sam. "What could we plan."

"Well," said Miss Ellen, thinking hard, "the apples in our orchard are getting ripe now. We might gather a basket of nice red ones to take to someone who hasn't any."

"I know, to little lame Jimmy," cried Evelyn. "They have no trees at all. He ought to like apples a lot."

"Yes!" voted the other children. "Let's take them to Jimmy."

"Come to my house tomorrow afternoon at three o'clock," said Miss Ellen. "We will go out to the orchid and gather the apples. Then we can take them to Jimmy. Maybe he would like to have us sing and say some of our verses for him too."

"I'll be there!" said Sam.

"We'll come, too" said the others.

Monday afternoon came, bright and cool.

"I'm glad it is such a pretty day," thought Miss Ellen. "The children will enjoy it more."

A little before three o'clock, here came Sam. He and Miss Ellen sat in the swing on Miss Ellen's porch to wait for the other children.

Three o'clock came, but no one else was there.

Three-thirty came.

"Those dopes are not coming," said Sam, darkly. "Always talking about doing things for others and never doing a thing."

"Maybe they forgot," said Miss Ellen. "We shall not wait any longer."

She put on her hat, gave Sam her basket, and they set out.

Sam opened the orchard gate and Miss Ellen led the way to the ripe apple tree.

"Oh, look at them! All over the ground!" cried Sam. "I'll be a hog and eat them up."

Down on his all-fours he went, nipping at first one big red apple, then another.

In spite of being a hog, Sam helped Miss Ellen fill her basket. He picked out the biggest, reddest apples he could find and crawled over to put each one in with the others.

This was fun. The other children did not know what they were missing!

When the basket was full, Miss Ellen and Sam took it to little lame Jimmy.

How bright Jimmy's eyes got, how thrilled he was when he saw the apples!

"Are they all for me," he cried, "every single one?"

"Yep," said Sam. "They are all yours, aren't they Miss Ellen?"

"They certainly are," she answered. "And now would you like to hear Sam say some verses he knows?

Sam started off with John 3:16.

"I know that one," said Jimmy. "My mother taught me."

Sam said another verse.

"Do you know that one?" he asked.

"No," said Jimmy, "but I know this one—" and he said a verse that Sam didn't know.

The two boys played a game, then each trying to say a verse the other did not know. Miss Ellen was surprised to find how many they knew.

"Sam is doing very well for the worst boy in school," she thought "Very well indeed!"

"My, my," she said, later, when both days had about run out of verses, "we've had such a good time that the afternoon has flown. It is almost five o'clock!"

"Then we'd better go," said Sam. "I have to get home in time to wash up for dinner."

"Will you come again?" begged Jimmy.

"We surely will," said Sam and Miss Ellen, right together. " We can say more verses, then. Maybe we can sing some songs, too."

With the Eighth Army In Sendia, Japan

Oct. 14, 1948— Corporal Yenn A. Benford, 432 Hancock Street, Murfreesboro, Tenn., has recently been named Coach and Tackle on the 55th Ordinance Ammunition Co., Football Team.

The 55th Ordinance Ammunition Company is attached to IX Corps, under the jurisdiction of Eighth Army. It is located on the outskirts of Sendai, 200 miles north of Tokyo.

Corporal Benford's team will play a scheduled six games in the Camp Sendai Football League. The winning team will be awarded a trophy at the end of seasonal play.

The 55th Ordinance Ammunition Company's Team were the Camp Sendai Football League Champions for the '47-'48 season.

FRY ASKS MORE GRAIN STORAGE SPACE ON FARMS

Carl Fry, chairman of the Tennessee PMA committee, today warned that immediate construction of additional grain storage space on farms is necessary in order to avert serious loss of feed and farm income.

The total 1948 grain crop for the nation—wheat, corn, oats, barley, rye and grain sorghums—is expected to reach over 6,500,000,000 bushels.

International Youth For Christ

Forty Gospel Teams to Forty-six Foreign Countries Organized At Winona Lake

Organization Adopted A Budget of Eight Hundred Seventy-two Dollars; Dr. Robert A. Cook, Thirty-six year Old Director Elected President.

Winona Lake, Indiana, July 18—Youth for Christ International this week adopted a budget of $872,000, prepared to send 40 Gospel teams to 46 foreign countries, completed final details for the World Congress on Evangelism at Beatenberg, Switzerland, from August 10-22, and elected as president Dr. Robert A. Cook, 36-year old director of Chicagoland Youth for Christ.

This fourth annual convention's budget is more than four times the budget two years ago. Enthusiasm was at a peak all week as delegates and directors from 260 cities in 36 states and five provinces of Canada prayed, worked and discussed the amazing growth of this 20th century youth revival movement.

Other important decisions.

(1) Setting of a goal of enlistment of 10,000 candidated for foreign mission service before the 1949 conference.

(2) Setting of a worldwide day of prayer for world evangelism on August 14.

(3) Launching of an intensive campaign to reach prospective draftees through Youth for Christ rallies in army camps.

(4) Scheduling of a mid-winter convention of Youth for Christ Leaders.

(5) Stressing of high school Bible clubs as a definite stop gap against juvenile delinquency and aids in Youth for Christ.

Dr. Frank Phillips of Chicago, executive vice president, reported a 20 per cent increase in rallies during the past 12 months. Youth for Christ International new employs 17 full-time evangelists, with 136 leaders working full-time through North America.

So enthused were the delegates and directors that within 40 minutes a total of $815,000 of the budget of 1948-49 was pledged.

Other elected officers are the following:

1st vice president, Rev. William Graham, Montreat, N. C.

Secretary, Edward T. Darling, Detroit, Mich.

Treasurer, William C. Bond, Washington, D. C.

World Secretary, Rev. Robert Evans, Chicago, Ill.

Regional vice presidents named include the following:

Pacific Northwest, Joe Weatherly, Portland, Ore.

Pacific Southwest, Roy McKeown Los Angeles, Calif.

North Central, George M. Wilson, Minneapolis, Minn.

Upper Central, Cedric Sears, Chicago, Ill.

Central, Al Metsker, Kansas City, Mo.

Eastern, Walter Smyth, Philadelphia, Pa.

Great Lakes, Edward T. Darling, Detroit, Mich.

Southeastern Don Mott, Orlando, Fla.

Eastern Canada, Evon Hedley, Brantford, Ontario

Western Canada, Watson Argue, Winnipeg, Manitoba

Dr. Torrey M. Johnson of Chicago, retiring president who has led this movement in its first four years as an International organization, was named to the Board of Directors. Johnson will be traveling extensively for Youth for Christ. Others on the Executive Board are Dr. Frank Phillips, Chicago; Cy Jackson, Des Moines, Iowa; Cedric Sears, Chicago; George Wilson, Minneapolis, Minn., and the four main officers.

Greatest emphasis in the world program is being placed in the Orient. In addition to the evangelism program, a total of $250,000 is assigned to clothing and food relief. The budget adopted is as follows:

Orient, $230,000.
China, $100,000
India, $60,000
Japan, $40,000
Korea, $10,000
Philippines, $20,000.
Australia and New Zealand, $20,000
Latin America, $45,000
Central America, $5,000
South America, $25,000
Mexico, $10,000
West Indies, $5,000
Alaska $5,000
Scandiavian countries $10,000
Europe, 134,000
Belgium, $5,000
France, $50,000
Germany, $40,000
Holland, $10,000
Italy, $20,000
Poland, $5,000
Portugal, $2,000
Switzerland $2,000
Field Administration and U. S. A. work, $108,000
World Congress on Evangelism, $25,000
World Relief, food, clothing, literature, $250,000
Total $872,000

The spark of evangelizing the world in this generation also has swung to Great Britain. British Youth for Christ reported a budget of $48,000 for the coming year, with four full-time workers and teams going to Portugal, France and Africa. A rally in Wuppertahl, German, recently drew 14,000 people. The first team of 1947-49, Dr. William Ward Ayer of New York City George Edstrom of Rochester, Minn., and Theodore Bergman of Minneapolis leaves for England on October 1.

World vice presidents elected are as follows:

British Isles, Rev. T. L. Livermore, London.

Netherlands, Hendrick Vande Bunt, Amsterdam

India, Rev. Hubert Mitchell, Calcutta

China, Dick Hillis, Shanghai

Far East, David Morken, Shanghai

Philippines, Gregorio Tingson, Manila

France, Boris Bessmertny, Paris

Poland, Joseph Marozek, Warsaw

Italy, Dr. Lucio Mirabelli Naples

Slavic, Rev. Peter Deyneka, Chicago.

The five inspirational and devotional services held daily resulted in 485 decisions for salvation, consecration and missionary service. Added to this was a thrilling missionary response on Friday evening July 16, when 350 young people filled the front of the Billy Sunday Tabernacle in response to the missionary call by Dr. Oswald J. Smith of Toronto. Dr. Smith told the crowd of 4,000, "If Youth for Christ should fail in this task of world wide evangelization, I know of no other organization in the world today that could do the job. Think to, this may be the last opportunity anyone will have of completing this job!"

In his acceptance mescsage, Dr. Cook said:

"The greatest day of Youth for Christ lie ahead of us. Under God and through prayer might we rock the world for Christ until the evangelization of the world is completed."

Enthusiasm reachced another height when final plans were outlined for the World Congress on Evangelism at Beatenberg, Switzerland, from August 10-22. Two hundred youth and religious leaders will leave by ship on July 30 and plane on August 8 for this world conclave. Following the 10-day sessions, 130 meetings will be held in 66 cities in 10 countries in a "spiritual invasion" of the Continent.

Of note at the convention was the report on relation of Youth for Christ to the church and vice versa. On every hand, directors reported an increased backing of pastors and churches. Voice of Christian Youth in Detroit has the support of 300 pastors, Ed Darling reported. Kaansas City Youth for Christ is so well thought of in its interdenomiational set up that Director Al Metsker has been asked to lead a great citywide, interdenominational revival campaign there this summer.

Next year's conference again will be held at Winona Lake, the dates to be from July 10-17.

You can't keep a good man down nor hold a bad man up.

USDA to Seek Way of Utilizing Negro Colleges in Agricultural Marketing Research Program

Washington, D. C.— A survey of the research facilities of the Negro Land-Grant colleges and associated institutions is to be made by the U. S. Department of Agriculture to explore the opportunities for utilizing them in carrying out projects under the Research and Marketing Act, said Secretary of Agriculture Charles F. Brannan this week.

A Negro specialist, trained in research technique and acquainted with the personnel and facilities of these colleges, will be appointed by early September to make the study, said Secretary Brannan. It is thought that the survey will require about four months.

Decision to make the survey followed a conference between the Secretary and his two special assistants, Dr. F. D. Patterson of Tuskegee, and Claude A. Barnett of the Associated Negro Press. Also, on several occasions within the last year, the Land-Grant College Presidents have conferred with Department Officials with regard to their institutions participating in research being carried out under the new act.

Secretary Brannan says that he hopes the survey may reveal ways by which the research personnel and facilities of these institutions may be used in carrying forward the Department's research responsibility in the important fields of utilization, marketing, and distribution of agricultural products.

Under the Research and Marketing Act, the Secretary is authorized to enter into contracts with public and private organizations, individuals, and institutions that he believes can perform certain types of research assignments in utilization, marketing, and distribution "more efficiently, more rapidly, or at less cost "than the Department. It is under such provisions that the research facilities of the Negro Land-Grant institutions may be employed in the program.

Up to now, however, none of these colleges has been assigned research projects, although several have submitted proposed studies. Department officials say that after the survey of the college is completed and the information on their personnel and facilities is analyzed, the Department will be in a better position to give consideration to project proposals or to recruit the assistance of the Negro institutions in carrying agricultural research forward.

White Land-Grant colleges also have not been fully utilized in the research program because of the inadequate information available on their personnel and facilities. Dr. R. R. Ronne, President of Montana State College, was appointed to make a similar survey of these institutions.

Proper Storage Required for Loans on Grain

Although loans are available to support the farm price of corn, oats, wheat and barley, they cannot be made unless the grain is stored properly, according to R. E. Westmoreland, acting chairman of the State Production and Marketing Committee.

Estimates indicate that Tennessee will be over ten million bushels short of enough proper storage space for the 1948 crop. Westmoreland points out that all of the large crop is needed and none should be allowed to spoil through improper storage.

SMITH: "I'm surprised that you permit your wife to go around telling the neighbors she made a man of you. You don't hear my wife saying that."

JONES: "No, but she told my wife that she had done her best."

Cotton Mechanization Research for Small Farms to Be Undertaken

Cotton mechanization — particularly the development of machinery suitable for small farms—is coming in for a big share of research under the Research and Marketing Act, said Secretary of Agriculture Charles F. Brannan in an address last week before the Annual Cotton Congress in Dallas, Texas.

Among the various phases of this research project. said Brannan, are attempts to develop uniformly dependable methods and equipment for harvesting cotton, for defoliating it before harvesting, preparing the seed-bed. delinting of cottonseed for planting, for weed control ,and better means of applying insecticidcs and fungicides.

Then there are problems of ginning mechanically harvested cotton, the Secretary continued. All this is either being studied, or will be. We are working also with several of the State colleges on the practical economics of mechanization, on how various projects fit together, on what it costs, and on how it pays off, Brannan told the Cotton Congress.

Good Pickles, Relishes Make Winter Meals More Enjoyable

By Mrs. Aubrey Hinton
(Banner Correspondent)

Adolphus Ky., Aug. 9—A quick way to make good relishes for winter is to first make the following mixture in a stone jar and have ready for use:

1 gallon vinegar. either white or 5 per cent acid. (some like the 5 per cent acid best)
1 cup sugar
1 10 cent package or bottle saccharine
½ cup salt
½ cup white mustard seed

We prefer to leave off mustard seed and use spices to taste, or none at all. Keep the above mixture well covered, ready for use.

For making cucumber pickles, wash cucumbers. drain and cut up into preferred size and shape for pickles, pack into clean fruit pars, finished filling with the vinegar mixture. seal and store for winter.

For making slaw, cut cabbage, ready for slaw, press lightly into jars, pour the vinegar mixture over it and seal.

We haven't tried making catsup this way, but some say to grind cabbage and tomatoes, half and half and pack away and pour this same vinegar mixture over it, like in making pickles and slaw.

Here an old fashioned recipe:

Pack well washed cucumbers, (leaving stem on them), into clean stone jars, a layer of salt—a layer of cucumbers, covering with cloth over which is laid a circular shaped piece of wood and weight down with a clean limestone rock, or one that will not crumble, keeping cucumbers covered with the briny water, and covering top of jar by tying heavy cloth over it.

This "layer of salt, layer of cucumber" way of keeping cucumbers for winter pickling keeps them well, provided they are kept weighted down, well covered and cucumbers are gathered, washed and packed away when pickle size and not too large.

It is not necessary for them to all be paeked away at one time, just keep adding "a layer of salt and a layer of cucumbers" until jar is filled. We keep our stone jars of eueumbers in smokehouse or eellar.

Whenever you eare to make pickles of them, take out enough to make as many as you want, cut eucumbers into slices, put into an enamel or stone eontainer large enough to cover well with water, let soak and change water (twice or more) until they are not too salty, paek into glass jars and pour either sweetened or sour vinegar over them and let soak until they suit the taste. This may not make a relish rich in vitamins, but it makes one that suits the tastes of most folks mighty well.

$70,000,000 Available to Southern Farmers in Loans and Insured Mortgages Through FHA

White and colored farmers of the South may obtain credit assistance up to 70 million dollars through the Farmers Home Administration between now and next July, the U. S. Department of Agriculture has announced.

Of the total sum, $8,400,000 may be borrowed directly from the agency by Southern farmers for the purpose of buying family-sized farms of their own. Also, the Farmers Home is authorized to insure farm ownership loans up to $62,000,000 which may be advanced by private lenders during the next 11 months.

Nation-wide, the Farmers Home can make direct farm ownership loans totaling $15,000,000, and can insure farm mortgage loans in the aggregate up to $100,000,000 this fiscal year.

These authorizations are divided among the States and territories on the basis of their farm population and percentage of tenancy.

Both types of loans are made to tenants, sharecroppers, farm laborers, and qualified veterans who have no other way of obtaining needed credit. Veterans have preference. Funds may be used to buy family-type farms, or to enlarge or improve inadequate units. Approximately 6,000 colored farmers have been aided by these programs.

Every loan is based on a careful appraisal of the land; and no loan can be made if the borrower's total investment will be more than the reasonable value of the farm based on its long-time earning capacity. The farm cannot have a value greater than the average value of all efficient family-type farms in the particular county. All loans are accompanied by supervision in improved farming methods.

Both insured and direct loans are for 40-year periods. But private lenders who extend credit to eligible farmers under the insured mortgage plan may assign the mortgages to the Government at the end of seven years and receive full payment. The borrower pays four per cent interest for either type of loan.

All applications for loans are made through the Farmers Home Administration county offices.

Following A Leader

By F. Coxe, Moody Bible Institute

The driver of the grey sedan twisted slowly along the country road. Rain slashed against the windshield, and he bend forward as he peered out to watch the tail light of the car ahead of him. Sparkling dimly in the rain, the tail light ahead led him up hills, around bends, through deep puddles.

"Glad he knows the road," the driver of the grey sedan muttered to himself as he squinted through the rain. Just then the tiny light disappeared.

For a second the rain cleared, and he saw that the road curved sharply around a small pond. But it was too late. His car plunged over the embankment, sinking dully into the soft mud. It grazed the fender of the car he had followed so closely. Leaping out of his car. he was startled to see not only one car in the mud with him, but two.

The driver of the car with the twinkling tail light stuck his head out of the window. "Sorry," he shouted. "I don't know this road. I was following this fellow ahead of me."

How many times are we "the fellow ahead," the driver in the first car? Unaware that anyone is using our actions as a pattern for their own, we live our days blithely and for our own enjoyment. Then we stand amazed and shoeked when we see others make mistakes beeause they are influenced by what theyhave seen us do. We never travel alone. We can never know how many are following us, so let us look ahead and up to Christ, the Perfect Leader. "Be thou an example . . . in word, in eonversation, in charity, in spirit, in faith,

Rural Residents to Be Helped by Air Parcel Post

Chicago, Ill. — Air parcel post, effective September 1, is expected to be of continuing increasing value to residents of rural areas.

With this new, fast and economical postal service. air delivery of goods is no farther away from any farm than the post box and as frequently as the daily visits of the rural carrier, it is pointed out by officials of United Air Lines which calls at 77 cities on its coast-to-coast, West Coast and Hawaiian routes.

Perishables— eggs, fruits, etc.,— now can be shipped at moderate cost over greater distances than was ever before possible. Rush orders for such essentials as farm tractor parts can be completed in a day or two, regardless of how remote the shipper may be from the consignee.

Rates start at 55 cents for the first pound, in the first zone, plus 4 cents for each additional pound, and range up to 80 cents a pound for delivery to the most distant points in the continental United States. Any package up to 70 pounds in weight and with a length and girth not exceeding 100 inches will be accepted. Over that, the shipper can avail himself of fast air express and freight service.

As United and other scheduled air carriers have agreements with foreign airlines, parcel post packages may be shipped to virtually any civilized part of the globe.

Inauguration of air parcel post marks the first time that air transported packages can be delivered by the postman directly to one's own home. Packages can also be sent special delivery for a slight extra fee, the amount depending on the weight.

South Gets Nearly Half of School Lunch Funds

Of the $58,800,000 school lunch fund set aside for the States and territories for the coming school term, nearly half of it has been earmarked for the South, the U. S. Department of Agriculture announced last week.

The Southern States and the District of Columbia will receive a total of $28,185,826, or 48 per cent of the school lunch fund.

The money is divided among the States and territories on the basis of need. This is determined by the number of children of school age and the per capita income of each State.

Among the Southern States, the largest share of the funds will go to Texas. North Carolina. Mississippi, Alabama, and Georgia. States outside the South receiving large allotments are: New York, Pennsylvania, Illinois, Michigan, Ohio, and California.

Congress appropriated $75,000,000 this year for the program. Of this amount, $16,200,000 is available to the Department of Agriculture for the purchase and distribution of specific foods to schools participating in the program and for administrative expenses.

It is estimated that about 6,500,000 of the 27,500,000 white and colored children in elementary and high schools will benefit from the program during the coming school year.

These children and approximately one million others in schools not receiving Federal School Lunch funds benefit from foods acquired and distributed by the U. S. Department of Agrieulture under the program.

The Great Difference

From the standpoint of the publie. what is the difference between a privately-owned utility and one whieh is owned by the state? A good answer to that is provided in an editorial in the Record, of Columbia, South Carolina.

"Privately-owned publie utilities,' it says, "are vested with such a direet public interest that the state does not allow the profit motive to operate freely in this field. Rates are regulated by the state and may be raised or lowered only as the state allows. And the valuation of the company's holdings for the purpose of rate fixing is determined also by the state, not by the corporation.

"The state-owned utility, however, is a horse of a different color. . . . . The taxpayers . . . do the buying, but they have no stockholder's eertificates to eertify to their ownership and they get no dividends from it. . . And because state-owned corporations and authorities are divorced from direct eontact wit hthe taxpayers, who foot the bill, it isn't required that the state-owned utilities be efficiently operated. It is only necessary that they be operated in eonformity to the rules of polities."

The Reeord eould have gone on to point out that the soeialized utility is an insatiable eater of tax funds, and that it pays little or nothing in taxes, while the privately-owned utility must pay its own way, and is taxed to the hilt in addition. If a private company loses money, no one subsidizes it —the stockholders go without dividends. The socialized business can be wasteful and everyone will be taxed to pay its losses.

You Can Use Dry Skim Milk to Add High Nutritional Value to Easy Picnic Menus that All the Family Will Enjoy

Whether you transport it fifty miles by car to the most beautiful spot you know, or just carry it out to your own backyard, a meal out of doors is a delight.

But it is important to plan sufficiently nourishing meals if you do much picnicking this summer. Grown-ups as well as children really will be the losers if they eat frequent picnic meals that are always below required nutritional standards.

You can look after this possible defect by enriching foods with dry skim milk. For instance, you ean add appetizingly to the nutritional value of a sandwich meal by making a rich, raisin-filled loaf of bread. As a filling when you use this bread, a thick spread of eream cheese gives a highly nutritious sandwich.

Dry skim milk, or nonfat milk solids, as it is called, has all the food value of fresh fluid milk with the cream poured off. Yet when reconstituted by the addition of water, this form of milk comes to only around six or seven cents a quart. So it can be generously and thriftily used in all sorts of cooking.

Picnie chocolate, too, can be made with dry skim milk—and a chocolate-milk drink at a picnic helps to boost the nutritional value of the menu in a highly popular way.

CHOCOLATE DRINK

1 cup dry skim milk
3 cups water
1-3 cup chocolate syrup
Dash of salt

Sprinkle dry skim milk over water. Beat until well-blended. Add chocolate syrup and salt, stirring until well mixed. Chill or serve hot. Makes 4 to 5 cups.

OATMEAL RAISIN BREAD

¾ cup water
1 cup oatmeal, quick-cooking
2 cups sifted enriched flour
4 teaspoons baking powder
¼ teaspoon soda
1 teaspoon salt
½ cup sugar
½ cup dry skim milk
1 cup raisins
2 eggs, well beaten
¼ cup molasses
¼ cup melted shortening, cooled

Pour water over oatmeal and let stand. Sift together flour, baking powder, soda, salt, sugar and dry skim milk. Add raisins. Combine eggs, molasses, shortening and oatmeal mixture. Stir liquid ingredients quickly into dry ingredients until mixture is just moistened. It may have a lumpy appearance. Turn into well greased bread pan about 9x5x3 inches. Bake in moderate oven (350 degrees F.) for 1 hour or until done. This is a moist loaf that cuts best on the second day.

Safety on the Railroads

As everyone knows, the railroads have long had an enviable record as one of the safest forms of transportation ever devised. And just how fine that record has become is detailed in a report made by the Interstate Commerce Commission and the Association of American Railroads.

Last year fewer people lost their lives in railroad accidents than in any of the 49 prior years covered by Commission statistics. The number of fatalities was 42 per cent under 1937, 58 per cent under 1947, and 64 pe rcent than in 1907. And this progress was made, as The New York TIMES points out, in the face of the fact that the volume of service performed is much greater than in the past.

The TIMES goes on to give a graphic picture of just how safe the railroads are. Last year their passenger service was equivalent to moving every man, woman and child in the country 319 miles—yet there were only 66 fatalities. As The TIMES puts it, "An individual traveling by rail at 50 miles an hour, 24 hours a day, would require almost 1,600,000 years before he could expect to be killed." It would be a timid soul indeed who'd worry when the odds are so enormously in his favor!

The railroads' achievement in the the field of safety, like their achievements in every other field of operation, didn't happen by chance. It came about through constant improvement of equipment—through the most careful training of personnel—and by hard work and watchfulness day in and day out over the years.

American Educational Week

Since 1919, The American Legion, the National Congress of Parents and Teachers, the United States Office of Education, and the National Education Association have cooperated each year in sponsoring a program designed to call to the attention of people generally the condition, the needs, and the function of public education. These activities, under the able sponsorship which they have had, have deepened the conviction of the American people that an adequate school program for all the children of all the people is essential for the safeguarding and perpetuity of our free institutions. This year these same agencies are sponsoring the observance of American Education Week from November 7-13, inclusive. The theme for the observance is "STRENGTHENING THE FOUNDATIONS OF FREEDOM." Even to the casual observer this theme will appear most pertinent. If there ever was a time when all people in our country should be concerned about the freedom, which we have cherished since the beginning of our country, that time is now. We live in a troubled world. Confusion abounds on every hand. Governments are established today and gone tomorrow. War clouds hover over peoples who love peace and who would honestly like to pursue a livelihood under favorable circumstances. It is obvious that our country, though apparently separated from the troubled areas of the world, cannot hope to eseape the blighting effects of confusion, antagonisms, and threats of war elsewhere.

It should be clear to all of our people that the one publicly supported, stabilizing ageney in our democracy is our system of education. This being true, it is highly fitting that all citizens avail themselves of the opportunity to visit their schools during American Education Week, get acquainted with the teachers employed therein, familiarize themselves with the purposes and funetions of the schools. and satisfy themselves that the institution, which we call the public school, is busy about the task for which it is maintained.

W. A. BASS.

Farm Wages Hit New High; Lowest in Southern States

Farm wage rates reached a new high a month ago, reports the Bureau of Agricultural Economics. They were seven per cent above a year ago and eight per cent higher than on April 1.

Total farm employment was down 400,000 from a year ago with hired employment the same as last year. Employment declined beeause of more favorable weather this year which made for a more even distribution of th ework load. There were 11,120,000 persons employed on farms on July 1. Of these 2,672 were hired workers.

Wage rates per day without board averaged $5.40 for the country as a whole compared with $5.17 a year ago and a July 1, 1935-39 average of $1.53. The largest wage increases were in the North Central States; the smallest increased were in the East South Central States — Alabama Mississippi, Tennessee, and Kentucky.

TOMATOES TAPED UP

Memphis, Tenn.—Mrs. G. M. Lahue has a neighbor, who uses a pateh to protect half-ripe tomatoes in her garden from decay. She seals the broken skins with scotch tape until the tomatoes in her garden are ripe.

The monthly payrolls of city governments throughout the country rose $31,000,000 between October, 1946, and October, 1947.

Local Veterans Organizations To Observe Armistic Day

All city and state veterans' organizations will jointly observe Armistice Day in Nashville on November 10 and 11 by honoring Joseph F. Albright, special assistant to General Carl R. Gray, Administrator of Veterans' Affairs. Washington, D. C., at a Fellowship Banquet on November 10, 8:00 p. m., at the Southern Training Institute, 610 Gay Street.

On Armistice Day, Mr. Albright will be the principal speaker at a meeting in the Auditorium of Tennessee A. & I. State College at 3:30 p. m. All veterans are urged to attend this meeting.

Albright's position as special assistant carries with it the responsibility of advising on matters of policy relating to the problems of minority group veterans. In the performance of this duty, he cooperates and councils with many organizations, among which are the National Assoeiation for the Advancement of Colored People, the Urban League, the American Council on Race Relations, the Southern Regional Council, the Negro Newspaper Publishers' Association, the Associated Negro Press, the National Council of Negro Women, the National Medical Association, the National Negro Business League, and the Fraternal Council of Negro Churches.

Albright was a public relations specialist in the Air Force and highly trusted investigator for Military Intelligence. His successful interracial civilian-military relationships won him the eognomen of "goodwill ambassador of the Air Force." He became the first Negro in the history of the service to deliver orientation lectures to the entire white personnel, officers, enlisted men, and civilians, by order of the Commanding Officers of those bases. He served with the rank of Master Sergeant, refusing upon two occasions to accept appointments to Officers' Candidate School, prefering to work among and in behalf of Negro enlisted men who were serving under white commands. In grateful expression for his efforts to make military life more pleasant for these men, he was, and still is, often referred to as a "GI's GI." His work won the repeated commendation of his Commanding Officers and the approval of the War Department. In a letter of commendation, made publie in February, 1944, he was highly praised by the White House for his work in building civilian war morale.

Albright has long been noted for his uncompromising fight for democracy, and for his pioneering into new fields. He was the first Negro to ever represent a white collar union (The American Federation of State, County, and Municipal Employees) in the St. Paul, Minnesota Trades and Labor Assembly, A. F. of L.; he was the first American Negro Catholic Layman to ever conduct a sustaining interracial radio program in the Northwest.

Prior to entering VA, Albright was the veterans' affairs correspondent fo rthe Associated Negro Press, and his popular column, "The Veterans' Lighthouse," appeared in more than a hundred and fifty newspapers. He is one of the most dynamic and forceful Negro orators in America. He is 47 years of age.

Citizens Savings Bank Honored

An invitation reached this city, Nashville, on Sept. 20th urging the Citizens Savings Bank and Trust Company's president and officers to attend a banquet sponsored by the Manufacturers Trust Company of New York, which was staged in the Book-Cadillac Hotel in Detroit, Michigan during the annual session of the American Bankers Association. Mr. Geo. W. Heiser of 55 Broad Street, sent the invitation on behalf of the Manufacturers Trust Company, which is a correspondent of the Citizens Savings Bank in the nation's metropolis.

The invitation requested a reply, hence, President Boyd, who had just returned from an extended trip to and from the National Bapt. Convention of America, acknowledged the receipt of the invitation and sent his regret on behalf of the officers of this institution, which is nearing its forty-fifth anniversary.

How Dry Are We?

(Of Interest to Temperance Workers)

We know how wet we are. During 1947 the people of the United State spent $8,700,000,000 for aleoholic beverages according to reports rcleased in Washington. This is nearly one billion more than what was spent for 1948. This means over $2000 per every drinking person. These persons lay a handsome contribution upon the altar of their God of Alcohol. But what results! Slavery, lost jobs, broken homes, premature death!

In working for repeal of National Prohibition, the liquor interest advocated moderation, temperance. Their high pressure program of advertisement gives the lie to their professed desire. The increased consumption of intoxicating beverages has paralleled with the increased liquor advertising on bill boards, newspapers, magaines, films radio. To reduce the evils of the use of alcohol, liquor advertising must be controlled.

Senator Capper of Kansas has introduced a bill S. 265 to prohibit liquor advertising in foreign and interstatc commerce. This bill would drive liquor advertising off the air since sound waves have no regard for state lines. It would make illegal to transport films or printed advertising of liquor from one state to another or to a foreign country.

This bill is sponsored by National temperance organiations, denominational leaders, Christian laymen in various vocations. A letter from the attorney for the Liquor Stores Association located in Albany, New York, came to the committee conducting hearings on the Capper Bill deploring the "high pressure (liquor) advertising to today whieh is not conductive to temperance" and says, "We sincerely trust that you will be successful in obtaining passage of this commendable piece of legislation." Well! Well!

We know how wet we are, but how dry are we? The Capper Bill should have the support of every Adult Bible class. Urge your senators to support this bill.

Hey Lady, There's No Difference in Cane, Beet Sugar

Are you one of those cautious housewives that go to the trouble of finding cane sugar for jelly-making?

If so, you might just as well save your time. There's no difference in sugar made from cane and that made from beets.

The two sugars are chemically the same, according to the U. S. Department of Agriculture.

Lower Prices on Way, Say Farm Groups

Washington, Sept. 30— (AP.)— Three major farm organizations have declared that "lower food prices are on their way as a result of record farm production this year."

The National Grange, American Farm Bureau Federation and National Council of Farmer Cooperatives issued a joint statement saying:

"The present downward trend in many farm commodities will be reflected on grocery and meat counters as the products of this year's bumper crops reach markets in increasing volume.

"Consumer prices have not yet reflected the declines averaging about 10 per eent in farm prices from the high point earlier this year.

"Lower prices for meats and other animal products are to be expected as the lower-priced and more plentiful grains are reflected in additional livestock production.

"But this will take time. Livestock numbers have been cut sharply in recent years to make more grain available for European aid, and it will take some time to rebuild livestock herds to fully utilize the more abundant grain supplies."

The farm organizations said that the farm price support program, eontrary to contentions in some quarters that they are responsible for high prices, "has kept food prices from reaching the heights which they would have, and did reach in many other countries."

The record farm production this year, nearly one-third above prewar averages, would not have been possible without price support programs to encourage maximum farm output, they said.

The farm organizations said a decline in farm prices can only be reflected partially to consumers "so long as processing, transportation and other handling eosts remain at present levels or continue to rise."

They argued that farmers would have less need for price supports if action could be taken to bring more stability into the general price level.

The farm organization contended that the average of farm prices is not out of line with the generally inflated national wage and income level.

They said that the average consumer can buy as much food today with 20 per cent of his income as he bought with 23 per cent of his pre-war income.

"A continuing farm price decline, while the prices of other products continue to rise," the farm organization said "would result in a collapse of the entire economy."

Pray On!

Pray on, then, ehild of God; pray on!
Whatever be thy soul's complaint;
Thy Lord hath said men ought to pray,
"Always to pray, and not to faint"

Pray on! Pray on! nor think to say
Believing prayer in vain can be.
God will avenge His own elect—
"He will avenge them speedily."

Pray on! Pray on! Cease not to pray;
And should the answer tarry, wait;
Thy God will come, will surely come,
And He can never come too late.

Pray on, then, child of God, pray on!
This is thy duty and thy task;
To God the answering belongs;
Thine is the simpler part—to ask.
—T. O. Chisholm, in Alliance Weekly.

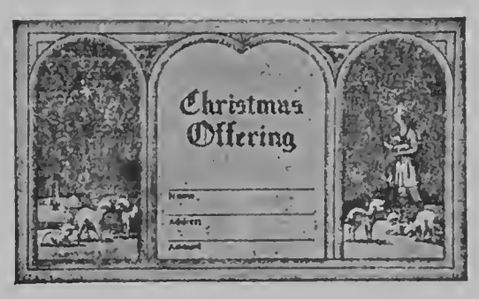
Christmas Helps

Our Christmas Exercise Edition
of the
CONCERT QUARTERLY
Is one of the most complete programs to be found. Full of beautiful Christmas Day Recitations, Dialogues, Playlets and Songs. Has no equal. 15c per copy—$1.50 per dozen.



Christmas Offering Envelopes
Artistically designed, produced in four colors, good quality of paper. Size 2½ x 4¼ inches—75c for 100; 250, $1.50; 500, $3.00.

Full from *Cover* to *Cover* of *New Material*
SONGS, RECITATIONS, DIALOGUES FOR CHILDREN OF ALL AGES
Price, 35c per copy

CHRISTMAS BUTTONS
Beautifully lithographed in colors 5c each; 50c per Doz.; 50, $2.00; 100, $3.50.

FOUR PLAYS FOR CHRISTMAS No. 1, A Pearl of Great Price—for 4 girls; No. 2, Silver of the Second Best—for 5 girls; No. 3, The Year's Great Guest—for 7 eharacters and 7 groups; No. 4, The Star Garden—for 7 characters and 6 groups—All in one binding; price, 35c per copy.
COME ANY TIME—A Christmas Comedy for 7 girls; price, 30c
WORSHIP THE KING—A Sacred Play—13 characters and chorus; price, 30c.
IN SANTA'S WORK SHOP—A play for children—21 characters. The group may be cut if desired; price, 25c.
HE CAME TO BETHLEHEM—A dramatic presentation for Christmas. May be used as a pageant. Price, 35c.
CHRISTMAS AT JOLLYVILLE JUNCTION—for young folks. A number of characters; price 35c.
CHRISTMAS EVE AND ALL IS WELL—A play in which any number may take part; price, 30c.
THE VISION ETERNAL—A Pageant Story Cantata—for choirs, choruses or selected groups; price 30c.
A CANDLELIGHT PAGEANT—with Familiar Hymns, Dialogues, Pantomime, Processional and Recessional. Price, 35c.

A Big Service at a Small Cost

When this nation began, practically everyone was a farmer. The average family raised and proccssed ncarly everything it needed to live on, and most of its time was devoted to the hard work of providing the bare necessities.

Today something like 26,000,000 people—a sixth of our population—live on farms. They supply the food for themselves and all the rest of us—plus an enormous additional quantity that is shipped abroad.

Various factors havc been responsible for this change. And one of those factors is an efficient system of bringing foods of all kinds from thc market to the towns and the cities. Meat is an excellent example. Relatively few people can go to a farmer, buy an animal, and store it away against their future needs. That's where the packing industry comes in. It provides what amounts to "clearing houses" in various sections of the country where meat animals can be sent to market. It slaughters and proccsses them, under a system of strict supervision which assures high sanitary standards. It distributes the meat to the centers of demand. And, finally, thc cuts appear in the butcher's showcases, ready for the table.

This is an cssential serviee. And the packers do it at a cost which averages but a fraction of a eent per pound on all the meat sold at retail. That is true whether prices are high or low. The packers do not fix the price. Supply and demand does that. Further, in order to hold the charge for handling the meat to the lowest figure they have made ingenious usc of the incdible by-products of slaughtering, for produetion of glue, fertilizer, drugs etc. Thc revenuc from thcse helps pay the expense for preparing and processing meat.

All in all, it's a complex busincss. And salicnt characteristics are efficieney and economy.

PRAISE FOR THE WORK HORSE

The results of a nationwide survey of public opinion in respect to the railroads have just been published. And they show that the people, by and largc, have a pretty sound idea of the importance of our basic medium of transportation.

First of all, the poll indicates, the country is overwhelmingly in favor of private operation of the industry. Only 13 per cent of those qucstioncd favored government ownership.

Scventy per cent said they cons.idered the rails to be transportation system most vital to earrying on the business of the country. Of those who knew that railroad freight rates have bcen increased recently, more than two-thirds felt that the increases were justified.

A growing preference for rail travel over othcr means was also expressed, on the grounds of safety, spaciousness, and freedom of movement.

One of the most interesting opinions produced by the poll dealt with what a fair return on the railroads' investment should be. The answers averaged 9 per cent which is more than 2 1-2 times the tate earned in 1947.

The high regard in which the publie holds our railroad system certainly isn't a result of accident. It is a tribute to magnificent performance by the industry, often under conditions of the greatest difficulty. The lincs have made every ear and every passenger train perform peak service. They are putting new and better equipment into duty as fast as the manufacturers can deliver it. They are the tireless work horse that keept the American economy going.

It won't be long before Congress will be asked to approve long-range farm legislation. The need for such a program is rccognized by every farm organization in the country and by every person engaged in farming. We have heard many express their desires and beliefs about it.

However, actions speak louder than words many times and this is one of thosc times.

Programs adopted to assist farmers in their soil conservation activities this year are now in the process of being carricd out.

The money allocated for these purposcs is less, but if properly used will mean a great deal to individual farmers and agriculture as a whole.

In order to administer a program of this kind it is necessary to have rules and regulations governing the use of funds and established dates for closing certain phases of the work.

Tennessee farmers arc nearing the deadline for filing farm plans or worksheets. May 1 was set as thc day for allocation of funds to individual farms several months ago, but thousands have not taken nccessary steps to become eligible.

It is highly resaonablc to believe that interest shown in federal farm programs already in effect will have a bearing on action taken when additional programs and present programs extensions are brought before Congress.

Some congressmen are not especially interested in the welfare of farmers and will do all in their power to limit federal aid to agriculture. Farmers are showing little apprcciation when they deliberately equip these men with wcapons to attack farm-mindd legislators by lagging behind and not meeting program dcadlines. Farm programs, no matter how good, are worthless without the full cooperation of farmers.

Many possess the misconceived idea that the program is not worth their trouble because it does not offer payment for practices they know to be good. They are wrong. Practices for which payment will be made were determined by farm-minded men who are attempting to aecomplish the most with funds available.

Since it costs nothing to file the work sheet and there is no rule forbidding a change in plans, cvery former should take advantage of the program.

By so ding those charged with the responsiblity of forming new programs will know they are attempting to serve.

It still isn't to late. Contact they have the support of those file a work sheet before May. your local AAA office now and

You should look about now and then and see what kind of job your neighbor is doing. You may have what you consider to be the best field of alfalfa in the country, but you ean't be sure until you see the other fellow's erop.

Best way to improve farming praetices in any community is to swap ideas and observe each other's work. Many farm tours are being planned over the state this summer. Some are county-wide, while others are confined to a single community. You can gain a lot by participated in one of them.

Many of us follow the same practices year after year. Others rotate their crops and practices and accomplish much more with less work. Why not find out how they do it? Plan to attend at least one tour this year.

Parfait Suggestion

Home-style parfaits make marvelous desserts. Just fill a tall glass with alternate layers of ice cream and preserves of any preferred flavor. Top with whipped cream if you wish.

If you are storing two flavors of ice cream in the refrigerator put them into the freezing tray in a "marbled" effect; coffee and chocolate ice cream arc delicious put together in this way and strawberry and vanilla make another good combination.

Reeord crops of rice, peanuts and pecans are predicted this year along with increases in irish potatoes, sugar cane, sugar beets and grapes.

Is The Church Failing?

Former President Of Pilgrim Youth's Organization Speaks

"America's Town Meeting of The Air," At Recent Conference Gives Facts

Grand Rapids. Mich.:—

I was a member of America's delegation (to the second World Conference of Christian Youth in Norway last summer). There thirteen hundred of us from seventy-onc different countries met to proclaim Christ's Lordship and to try to understand each other and our job as Christians. I wish I had time to tell of the meetings between these many groups which helped us to understand that we held a common loyalty that transcended our differences. The fact that such a meeting could be held at all in these times indicates to mc that the Church is not failing completely to meet the needs of youth. The young person today who wauts to find international fellowship will find in the Christian church the most widespread world-wide organization that he as an ordinary citizen may join.

The church is changing the lives of young people through effectively presenting the gospel. Though this happens in many ways, most important, I think, is the summer conferences or church camp. Here youth are learning the church's message for all of life, as they live 24 hours a day as Christians sharing work and play as well as worship, learning standards that can carry over into every aspect of daily life. In classes they become aware of the relation of the gospel to social and economic problems. Often around a campfire on the last evening I have heard halting but powerful testimonies about the power that had come into young lives that week. These young people join literally millions of others who look back to some summer camp or conference in the past thirty years at which they accepted the faith that has since been the framework of meaning for their lives. These conferences, and denominational youth fellowships which sponsor them, are to me living proof that the church is not failing youth. Through such organizations young people are daily bcing built into the world fellowship represented by the Oslo conference, and, more important, into the invisiblе fellowship of the everlasting church of Christ.

Two Members of Meharry Medical College Prominent in Recent Meeting in Los Angeles, Calif

American College of Surgeons Attracted Nation-Wide Attention in Its Session Held on the Pacific Coast.

Los Angeles, Calif (Special)—Physicians, surgeons and members high up in the medical psofession of the world, attended the American Collegc of Surgeons in this "City of Roses" and the capital of the movie world. Among those who stood out were Dr. R. L. Jackson of Baltimore, Md., a graduate of Meharry Medical College, Class '21, who is now a member of the staff of the Provident Hospital, and a speeialty in the field of General Surgery, who was inducted into the college of surgery. Along with him was his classmate and personal friend, Dr. W. A. Beck of Class '21 Meharry Medical Collcge and a Fellow of the American College of Chest Physicians, who also specializes in Internal Medicine and Chest Diseases.

Dr. Beck's son, W. A. Beck, Jr., is now a student in Meharry Medical College in Nashville, Tenn.

Among the other physicians who were here at the time was Dr. Matthew W. Walker, who is rated as the highest member of the present staff of Meharry Medical College. These and other sons and daughters of Meharry were conspicuous throughout the convention and made a definite contribution to this organization of some of the nation's outstanding members and men who specialize in materia medica.

Mrs. Jones and Miss Hunter Attended Lesson Committee

National Baptist Publishing Board Had Three Representatives at the Uniform Group Meeting in Toronto, Canada.

Three representatives from the National Baptist Publishing Board registered, qualified and attended the Uniform Lesson Committee, a part of the International Council of Religious Education, that held its session in the Royal York Hotel in Toronto, Canada. They were Mrs. Julia Coleman Jones, Miss Mae E. Hunter, two editorial assistants from the editorial department, and the secretary of the Board, Rev. Henry A. Boyd. The meeting adjourned on Friday of last week in Toronto. Mrs. Jones and Miss Hunter then went to Buffalo, and from there over to Rochester, New York, to be guests of the Hunter sisters, while Secretary Boyd went from Toronto, Canada directly to Decatur, Illinois, where he was a guest speaker at the Missionary and Educational Convention of that state, and from there to Chicago, then back to Nashville.

He reported on his arrival in the city that the two editorial assistants were well received by the chairman and secretary of the Uniform Lesson Committee, which had representatives from forty different denominations

The two members were assigned to two separate groups and helped to block out the Lessons and to make their contribution in several cycles, 1953-54.

Complete Eight Weeks of Training

Fort Dix, N. J., Oct. 27—The following named men from Nashville, Tenn., have eompleted eight wecks of Army basic training with elements of the 9th Infantry Division, Fort Dix, New Jersey.

They are Recruits, James E. Rose, 1276 Lewis Strcet; Clyde S. Williams, 2122 14th Ave.; Daniel Rufus Fenton, 1714 Heiman St.; James E. Davis, 65 Maury Street; John William Cowan; Iral Blake; and Charles Kimble, 1395 Lewis Street.

The following named men from Memphis, Tenn., have completed eight weeks of Army basic training with elements of the 9th Infantry Division, Fort Dix, New Jersey.

Thcy are Reeruits Robert L. Holeman, Earl Thomas, 1009 Melrose St. Lindsey Miller, 694 Vollintine St.; Willie McCoy, RFD No. 2; Robert Phillip, 485 Melrose St; Willie Holmes, and Charles Huddleston I, 364 N. 3rd St.

The following named men from Bristol, Tenn., have completed eight weeks of Army basic training with elements of the 9th Infantry Division, Fort Dix, New Jersey.

They are Recruits Thomas Essa Saunders, 515 McDowell St.; Reginald Bernard Mead, 717 English St; and John Henry Goodrum, 650 English St.

Make-up Hint

Here is a bit of motion picture make-up technique which Max Factor, Jr., suggests you try: Apply just a faint touch of skin cream to your eyelids before putting on eye shadow. It will make the shadow blend on more smoothly than it otherwise might, the adds a desirable extra sheen to the application. But don't cream over the shadow.

With the Eighth Army In Kobe, Japan

Oct., 1948 — Private Harold A. Bugg, son of Mr. and Mrs. A. J. Bugg, 901 Marina St., Nashville, Tenn., is now serving with the occupation forces in Kobe, Japan.

Kobe, which has long been known as Japan's leading seaport, is performing a major part in the occupation of Japan by acting as a receiving center for the supplies that keep the occupation forces of all southern Japan moving. Pvt. Bugg is himself figuring largely in the mission given Kobe's officers and enlisted men.

However Pvt. Bugg is also given ample leisure time in which he may attend the numerous special service facilities that are located convcniently near his quarters. There are three modern movie theaters located in Kobe along with six clubs operated for the officers and enlisted men of this base.

Joining the army in August 1946 at Fort Benning, Ga., Private Bugg came to Japan in January 1947.

Upon his arrival in Japan he was assigned to Company "B" 1st Battalion, 24th Infantry Regiment in Kobe. This unit performs an important part in the occupation of Japan by guarding food and supplies in the many warehouses at Kobe Base.

Prior to his entrance into the army, Private Bugg attended Pearl Senior High School and is now holder of Japanese occupation Ribbon.

Maury County Farm Woman

By Lera Knox

A very nice thing happened to me this week. It all eame about from a pan of rolls ready to go into the oven for supper.

Company came in, the telephone rang, and with one thing or another I almost let the rolls rise too long.

I finally got them in the oven and sometime later took them out with a degree of apprehension that they might have become too yeasty to taste their best—but not those rolls. They were more than perfect.

I rushed right away to Mrs. Huntsman for her recipe for rolls that will wait while their bakes takes time off to answer the telephone. Mrs. Hunstman recently moved to our place from Lexington. She says that this particular recipe seems to have originated with some of the good, old-time colored cooks, and has rather thoroughlv "riz all o'ver the country.

MRS. HUNTSMAN'S ROLLS

(Halve the recipe if you have a small family.)

1 quart milk
1 cup shortening
1 cup sugar
1 yeast cake
1 teaspoon salt
1 teaspoon soda
1 teaspoon baking powder
Flour to make dough

Combine milk and shortening, add sugar and warm until shortening is melted. Do not boil. When lukewarm, add yeast and enough flour to make thick batter. Let rise two hours. Then add soda, salt, baking powder and more flour. Kncad well until the dough seems "satiny." Make out rolls, let rise and bake, or keep covered in refrigerator until ready for use. Mrs. Huntsman doesn't rccommend that the dough not be kept too long. Better make smaller batches more often.

A treasure from my little black book is Mrs. George Norton's great-grandmother's English Ladies' Tea.

Here's the recipe:

½ dozen cloves
1 teaspoon tea (black)
6 cups boiling water
1 stick cinnamon
½ lemon (whole)

Brew 5 minutes, and serve.

Valencia oranges are green when ripe, at their most mature stage.

WOMAN'S PAGE

KEEPING HOUSE
by Norma Crane
FAMOUS HOME ECONOMIST

By Norma Crane,
Famous Home Economist

THE FUN IS IN THE FLAVOR:

If you add mayonnaise to the potatoes while they're still hot, your potato salad will double its taste appeal . . . Add a dash of cinnamon to your chocolate desserts and you'll enjoy a new taste thrill . . . For delicious iced coffee, add 1 teaspoon of cocoa before brewing. . . . Vanilla extract was introduced into American cookery by a French woman in 1847. She requested her druggist, Mr. Burnett, to prepare a flavoring similar to one used in her homeland for making custards, puddings, etc. The result was a delightful all-around flavoring which is still used today, to enhance almost every cake, dessert, and sauce made.

YEAR 'ROUND BARGAINS: You can find bargains every day in the year. No fan-fare, or advertising. They've always been there, but have you taken advantage of them? When you buy 100 one cent stamps for a dollar, do you then purchase writing paper or perhaps have cards made up, or do you take advantage of Uncle Sam's offer: 100 pre-stamped postal cards for a dollar? When you send a sealed parcel, do you pay 1st class fees or do you paste a printed sticker that states, "This parcel may be opened for postal inspection" and thus send it as fourth class mail which is much less expensive? When you send valuables through the mail, remember that insuring them means their value will be repaid in case of loss; while registering them means that they will not be lost and that they will receive special handling.

NEW ENGLAND DINNER

4 lbs. corned beef
1 cup water
1 onion
2 bay leaves
6 medium unpeeled beets
6 carrots
6 potatoes
Salt
1 head green cabbage, quartered
Parsley and tomato flowers
Butter

Wash corned beef and soak for one hour. Drain off water and place corned beef on rack in cooker kettle. Add water, onion and bay leaves. Bring to steam on high heat. Turn heat low and cook two hours. Season beets, carrots and potatoes with salt and place around meat. Place cabbage on top. Turn heat high until steaming again and then to low and cook 35 minutes. Arrange corned beef and cabbage on platter. Serve other vegetables with butter.

CORNED BEEF HASH WITH CABBAGE WEDGES

2 cups corned beef hash
1 small head cabbage
1 cup cheese sauce

Form hash into four individual loaves. Place on a greased baking sheet. Bake in a hot oven (400 degrees F.) approximately 10 minutes or until hash is browned and heated through. Cut cabbage into four wedges. Place in boiling salted water and cook about 10 minutes or until cabbage is just tender. Arrange hash loaves on a platter and place cabbage wedges topped with cheese sauce on either side of hash. Serves four.

RECIPE OF THE WEEK
MINT SAUCE FOR LAMB

1 cup vinegar
1 tablespoon sugar
⅛ teaspoon salt
½ cup of chopped mint or
¼ cup of powdered dried mint leaves

Put all of the ingredients in a sauce pan and bring to a boil. Serve hot or cold on hot or cold roast lamb.

BEAUTY AIDS: When your hair is drooping limply and you have an unexpected date, set your curls with cologne, instead of water. The result is amazing—fluffy hair in no time at all because the cologne dries so fast. However, since the constant use of cologne in setting the hair may cause dryness, reserve it as a quickie for emergencies only.

GLAMOUR FOR THE EYES: If the upper lashes are slightly curly, they will look longer. It's not necessary to curl them unless they are absolutely straight. Just brush a little mascara on them with an upward stroke to emphasize their tendency to curl . . . A speck of mascara can be removed easily and neatly from the face of eyelid by wiping with a wisp of moistened cotton wrapped on the tip of an orange stick . . . To make an eyebrow where practically none exists, use brown eyebrow pencil to make the line and then with a black pencil sketch in short hair strokes. The result is much more natural than using one shade of pencil only.

EGGSACTLY: Refrigerated eggs can be boiled without cracking by making a tiny hole in the large end of each one with the point of a needle. All eggs contain a certain amount of air, and it is this expanding air that causes the egg to crack when heated. The small needle hole allows the air to escape.

SPICED CORNED BEEF AND GLAZED YAMS

1 cup apple juice
Cloves
¾ cup brown sugar
2 tbsp. fat
1½ cups corned beef (chopped)
4 yams or sweet potatoes, cooked, peeled an dleft whole

Combine apple juice, brown sugar, and fat in deep 9-inch skillet. Boil three minutes, stirring occasionally. Place meat in center of skillet and surround with yams. Cover and simmer 20 to 25 minutes. Baste with syrup several times during cooking to glaze meat and yams. Serves four.

EGGPLANT-OLIVE CASSEROLE

2 tablespoons chopped green sweet pepper
1 minced clove garlic
1 tablespoon oil
1 large eggplant
1½ teaspoons salt
½ cup water
½ cup ripe olives
1 egg
½ cup dry bread crumbs
2-3 cup grated American cheese

Cook green pepper and garlic slowly in oil for 5 minutes. Pare and dice eggplant and add to garlic and pepper. Add salt and water; cover closely and cook 15 minutes. Cut olives from pits into large pieces. Beat egg lightly and add to cooked vegetables. Stir in olives and about two-thirds of the crumbs and cheese. Pour into greased 1½-quart casserole, and top with remaining cheese and crumbs. Bake in moderately slow oven (325 degrees) 25 minutes.

CORNED BEEF

With Cabbage It's a Combination Which Has Many Supporters Among Those Who Know the Best in Foods

By Mary Lyles Wilson

Corned beef and cabbage is a combination which has other advocates than Jiggs of the comic strips. The combination offers two very healthful foods, for beef tops the list for popularity in meats, and cabbage is one of our most important vitamin-laden vegetables.

To prepare corned beef for the table, allow the portion to be cooked to stand from an hour to an hour and a half in cold water. Drain and place in cooker with sliced onion, celery and carrot (using one of each to every five pounds of beef). Add two teaspoons of vinegar and cook slowly until very tender, allowing 40 minutes for each pound. Allow to cool, just as you do ham, in this liquid.

To use this with cabbage, add wedges of cabbage for the last half hour of cooking. Serve the beef in the center of a plate surrounded by the cabbage wedges.

HOMEMADE SANDWICH BUNS

Just plain good food is the keynote of a quick menu of well-done hamburgers on enriched sandwich buns, served with plenty of garden fresh salad.

A serve-yourself meal which features hamburgers and relishes is certain to draw many comments of "what fun this is!" Sandwish buns from the bakeshop or made at home give the 'burgers that wonderful special flavor. When made at home, the buns are easily shaped from a plain yeast dough by rolling into small balls and flattening to the desired shape.

With the picnic season in full swing, it is a good idea to bake enough buns at one time to take care of sandwich needs for several days. Careful storage preserves their fresh quality. Incidentally, the buns taste wonderful when toasted over an open fire.

On other occasions you may wish to let the nearby friendly baker save you time and energy. The enriched sandwich buns he supplies also provide the important B-vitamins and iron of these homemade buns.

SANDWICH BUNS

2 packages yeast, compressed or dry
¼ cup lukewarm water
1 cup milk
¼ cup sugar
2 teaspoons salt
¼ cup shortening
2 eggs
4½ cups sifted enriched flour (about)

Soften yeast in lukewarm water. Scald milk. Add sugar, salt and shortening. Cool to lukewarm. Add eggs. Beat until blended. Add softened yeast. Mix well. Add remaining flour to make a soft dough. Turn out on lightly floured board and knead until smooth and satiny. Place in lightly greased bowl. Grease surface. Cover. Let rise until doubled (about one and one-half hours). Punch down. Shape into number of buns desired by rolling into small balls and flattening to form sandwich buns. Place on greased baking sheets. Let rise until doubled (about one hour). Form remaining dough into smooth ball. Grease surface lightly. Cover and put into refrigerator. When wanted, remove dough from refrigerator and punch down. Mold at once, or if preferred, let dough stand in warm room for an hour before molding. Let rise until doubled. Bake in moderate oven (375 degrees F.) about 18 minutes.

Yield: Two dozen four and one-half inch buns.

CORN MEAL PONES

2 cups corn meal
1 tbsp. flour
1 tsp. salt
1 tbsp. fat
¾ cup boiling water
Milk or water

Mix meal, flour and salt and scald with threefourths cup boiling water. Add one tablespoon fat or drippings and enough water or milk to make into molding consistency. Mold in size and shape desired and place on a lightly greased griddle. Bake 35 or 40 minutes (until browned) in 375-degree oven.

CHEESE-VEGETABLE MEDLEY

1½ cups cooked elbow macaroni
¾ cup diced celery
¼ cup coarsely chopped green pepper
¾ cup cooked peas
¼ cup cheddar cheese, diced
¼ cup mayonnaise
1 tablespoon milk
⅛ teaspoon celery seed
1 tablespoon minced onion
½ teaspoon salt
Dash of pepper
Dash of garlic powder, if desired
1 tablespoon chopped pimento

Arrange chilled macaroni, celery, green pepper, peas and cheese attractively on a bed of lettuce in a salad bowl. In the center place the mayonnaise thinned with the milk and seasoned with onion, celery seed, salt, pepper and garlic powder. Garnish with the pimiento. Makes 8 ½-cup servings.

EASY CARAMEL ICING

2 cups sugar
1 cup buttermilk
1 tablespoon soda

Boil to soft ball stage. Drop in lump of butter. Let cool. Beat until thick and spread.

TO KEEP CHEESE MOIST

A Kansas housewife reports she has hit upon a way to keep the cut edges of cheese from drying out. She rubs the cut surfaces of American, aged American cheddar, Swiss, or Gouda cheese with a little margarine. Then she wraps the cheese in waxed paper and puts it into her refrigerator. Thus protected, it should keep several months.

If you are serving chilled cream of chicken or mushroom soup be sure to garnish each bowl with a bright vegetable. Use very thin slices of radish, thin cucumber strips, chopped green pepper or parsley, coarsely grated carrot.

GINGER ALE FRUIT SALAD

2 envelopes (2 tbsp.) unflavored gelatin
¼ cup cold water
½ cup hot grapefruit juice
½ cup light corn syrup
⅛ teaspoon salt
1 pint ginger ale
½ cup halved seedless white grapes
½ cup diced orange
1 cup diced grapefruit
½ cup diced canned pineapple
¼ cup broken nutmeats
1 lemon juice

Sprinkle gelatin on cold water; dissolve in hot grapefruit juice. Add corn syrup and salt; mix well. Add ginger ale and lemon juice. Chill until syrupy. Fold in fruits and nuts. Pour into mold which has been rinsed in cold water. Chill until set. Serves 6.

Most foods that go into the refrigerator should be kept tightly covered. Meat that has not been cooked is an exception to this rule. Cover it only lightly, since tight covering promotes bacteria growth.

Add a small amount of chopped apple to a tuna fish and celery salad; moisten with mayonnaise and serve on leaves of romaine. Garnish with thin slices of scored cucumber.

PAPER THINS

1 cup shortening
1 cup sugar
1 egg
2 tablespoons evaporated milk
1 teaspoon vanilla extract
2 cups sifted flour
1 teaspoon soda
1 teaspoon baking powder
½ teaspoon salt

Have pans and oven ready so that cookies can be baked immediately after mixing. Cream shortening and sugar together. Add egg, milk, and vanilla. Stir until thoroughly mixed. Sift flour with soda, baking powder and salt. Stir into first mixture. Dough will be soft. Pull off small pieces of dough and press with palm of hand on greased baking sheet to shape. Bake in a hot oven (400 degrees) 10 minutes.

ADVENTURES IN GOOD EATING

By Duncan Hines

A favorite with young and old alike, particularly in the summer time, is ice cream with chocolate sauce. This rich creamy chocolate sauce is simply prepared, and requires no sugar.

Cut ½ pound marshmallows into small pieces, shave 2 squares of bitter chocolate, and 2 squares of sweet chocolate, and place in a double boiler with ½ cup of cream. Let these ingredients stand over boiling water, until dissolved. Stir often. Serve on ice cream. Will keep well in covered jar in the refrigerator.— (Copyright, 1948. The Bell Syndicate, Inc.)

GAPE-PEACH JAM

4 cups prepared fruit
½ cups sugar
1 box powdered fruit pectin

Stem about 1½ pounds of fully ripe seedless grapes. Crush thoroughly or grind. Peel and pit about 1½ pounds of soft ripe peaches. Grind or chop very fine. Combine fruits and measure 4 cups into a large saucepan.

Measure sugar and set aside. Place saucepan holding fruit over high heat. Add powdered fruit pectin and stir until mixture comes to a hard boil. At once stir in sugar. Bring to a full rolling boil and boil hard 1 minute, stirring constantly. Remove from heat, skim, ladle quickly into glasses. Paraffin at once. Makes about 9 six-ounce glasses.

DEVILED CHEESE SPREAD

Few there are who will not cast a vote of approval for tangy deviled cheese as a sandwich filling. It is good for stuffing chilled celery stalks, too. Its easy preparation makes it popular with the one in charge of the cooking department. Simply combine and mix well the following ingredients: One cup grated American cheese, 3 tablespoons tomato ketchup, 2 teaspoons prepared yellow mustard, 2 teaspoons cider vinegar, and a dash of pepper.

ZUCCHINI WITH CHEESE SAUCE

Wash three medium-sized zucchini squash but do not pare; cut in one-quarter inch slices. Cook in a very small amount of boiling salted water until tender. Melt 4 tablespoons of butter or margarine, add 4 tablespoons of flour and blend well. Add 2 cups milk gradually and stir until thickened and bubbly. Season with 1 teaspoon salt, 1½ teaspoons Worcestershire sauce and a dash of cayenne. Add 2 cups grated Cheddar cheese (½ pound) and stir over very low heat until melted. Serve sauce over cooked zucchini.

Fresh corn for fritters, puddings or pancakes may be easily removed from the cob if you cut the corn down the center of each row of grains with a sharp knife, then scrape the kernels from the cob with a table knife.

THE MODERN FARMER

VOL. XXI. • NASHVILLE, TENN., NOVEMBER 15, 1948 No. 10

DEC 23 1948
U.S. DEPARTMENT OF AGRICULTURE

10,000 A Year Farmer Counts On No Single Cash Crop

Facts Announced In 1948 Cotton Loan Program By Department Of Agriculture

Washington, D. C.—The following details of the loan program covering upland cotton produced in 1948 were announced today by the U. S. Department of Agriculture.

Loan Rate. The average loan rate 7-8 inch Middling cotton, gross weight will be 28.79 cents per pound, which is 92 1-2 percent of the parity price of cotton as of August 1, 1948. The parity price on August 1 is 31.12 cents per pound. Last year the average loan rate (92 1-2 percent of parity) for **7-8 inch Maddling** cotton, gross weight, was 26.49 cents per pound.

The average rate for 15-16-inch Middling cotton will be 195 points (1.95 cents) per pound above the average rate for 7-8 inch Middling cotton. The loan rate will apply to the gross weight of the cotton and the average rate for 15-16 inch Middling cotton, gross weight, will be 30.74 cents per pound.

Premiums and discounts for grade and staple in the 1948 loan program will be calculated in relation to the loan rate on 15-16 inch Middling cotton. The schedule of premiums and discounts for grade and staple applicable in the 1948 loan program was issued on May 24, 1948 when an interim loan program was also announced.

Location Differentials. The loan rates will vary according to location. The rate for 15-16 inch Middling cotton, gross weight, will vary from a high of 31.44 cents per pound in the concentrated mill area of the Carolinas to a low of 30.02 cents per pound in Arizona and California.

Location differentials for each warehouse point will be based on the freight rate to the mill area of the Carolinas, except in eastern Tennessee, Virginia, North Carolina, South Carolina, Georgia, Florida and Alabama where a zone system will be in effect. The accompanying schedule defines the mill area and shows the variation in loan rates by counties for the zoned area.

Other Provisions. Loans will be made on cotton represented by warehouse receipts issued by warehouses approved by Commodity Credit Corporation. Cotton producers' notes will bear interest at the rate of 3 per cent per annum and will mature July 31, 1949, but will be callable on demand. Loans will be available until May 1, 1949.

Producer eligibility requirements are defined in Cotton Loan Instructions issued by CCC. Loan forms are being made available through approved cotton warehouses, approved lending agencies, and county agricultural conservation association committees.

Lending Agencies. Loans will be made direct by the Commodity Credit Corporation or through landing agencies, principally banks, approved by the Corporation. Requests for approval as lending agencies should be directed to the New Orleans CCC Office, Production and Marketing Administration, New Orleans, 12, La.

$70,000 Earned From Farm Projects By Delegates To 4-H Club Encampment

Washington, D. C. —The rural boys and girls from 16 States who were delegates to the first Southwide 4-H Club Camp have earned more than $70.000 from farm and home projects, according to State Extension Service reports received by the U. S. Department of Agriculture.

The delegates spent one week, August 24-31, in encampment at Southern University, Baton Rouge, La. The camp was sponsored cooperatively by State and Federal Extension Service.

While most of the delegates to the camp have made earnings off their farm and home projects—some of them ranging up to $7,000—cash earnings were not the major objective or principal achievement of 4-H'ers, say Director of Extension Service M. L. Wilson. He points out that many of the accomplishments of the youths such as the development of leadership qualities and the increased application of their training in health and hygiene and in better farming and homemaking practices cannot always be measured in dollars.

For example, many of the delegates who reported no earnings. from their projects described how their participation in the 4-H program has helped to improve their homes and communities. Some of the youths report that they have repaired their furniture, redecorated rooms in their homes, beautified their yards, made over old clothes for themselves and their younger brothers and sisters, and joined in community cleanup programs, hospital drives, and Savings Bond campaigns.

However among the 4-H delegates who have been most successful in obtaining learning and earnings from their projects over the years are: Clayton Marcus, 20, of Camilla, Ga., who has earned $7,000 from his projects; Milton J. L. Spright, 20, of Middleton, Tenn., who has earned $5,140; James D. Campbell, 18, of Moro, Ark., $3,983.55; Andrew Alexander, Jr., 20, of Monticelli, Fla., $3,792; Jerry Thomas, 19, of Gallion, Ala., $3,500; Henry Lee Swimpson, 19, of Robinsonsville, N. C., $3,341; Alonzo L. Ponder, 18, of Wewoka, Okla., $3,220.

Among the 4-H girls, Miss Nola Maxine Gillespie, 18, of Spring City Tenn., has earned the largest amount, $1,073.15; Miss Doreatha M.

(Continued On Page 4 Col. 5)

Exhibits Ready for Southwide 4-H Camp

Nine panels of exhibits showing the varied activities of 4-H club members are ready for the first Southwide 4-H club camp to he held August 24-31 at Southern University, Baton Rouge, La. Taking a last minute look at the exhibits prior to their shipment from the U. S. Department of Agriculture in Washington are: (left to right) Keith Himebaugh, USDA Director of Information, Walter H. Conway, Assistant Director of Extension Service, and Sherman Briscoe, USDA information Specialist.—USDA Photo by Forsythe 8-16-48.

Ross C. Owen, Tuskegee Football Coach, Directed Recreational Activities In Baton Rouge, La.

Washington, D. C.—Ross C. Owen, Tuskegee's backfield football coach, directed recreational activities at the first Southwest 4-H club camp, August 24-31 at Southern university, Baton Rouge, La.

Mr. Owen, who has had a wide and varied experience in the field of physical education, reported a well rounded recreation program for the 4-H delegates who were in attendance from 16 states.

Recently the American Red Cross awarded Coach Owen a certificate of appreciation and a five-year volunteer service model for his services as a volunteer instructor in the Red Cross water safety campaign.

In addition to serving as backfield coach and assistant director of

Charles L. Fussell Of Georgia Named South's Soil Conservation Champion No. 1 for 1948

Washington, D. C.,—Charles L. Fussell, Georgia colored farmer who protects every cultivated acre of his farm at Blackshear against erosion by planting them to cover crops during some period each year, has been acclaimed the South's No. 1 Negro soil conservation farmer for 1948.

Mr. Fussell won this unique honor in competition yith the Negro soil conservation champions from nine states at the annual Southwide Soil Conservation Jamboree at Log Cabin, Ga., on Friday, August 6.

The presentation of the $150 grand prize award was made by Dr. Benjamin F. Hubert, former

Mitchel E. Erwin Operates 200-Acres Near Tyler, Texas

Tyler, Texas—"You know, getting into farming is like catching a bear by the tail," says Mitihell E. Erwin, $10.000-a-year colored farmer who operates 200 acres near Tyler, Tex.

"I never planned to be a farmer; I wanted to be a businessman," says Mr. Edwin, "and after completing about half my freshman year at Butler College, I dropped out of school and started farming to get a stake to go into business.

That was over 30 years ago and Mr. Erwin is still farming, althoogh not to get a stake to go into bosiness—with him farming is a business, and a highly profitable one.

The year before the outbreak of World War I, Erwin started farming as a tenant. Anxious to make that business stake, he rented 100 acres and hired workers to help him grow a big cotton crop. But what the boll weevil didn't get of his crop went for labor and food. So, Erwin found himself in debt at the end of the year—he had the bear by the tail.

Determined to profit by his mistake, Farmer Erwin cut down on his labor costs by planting less cotton and in its stead planting a few vegetables. By selling vegetables in summer and fuel wood off the farm in winter, he managed to keep his second crop almost debt free. And he received enough from his cotton to pay off his old debts and make the down-payment on 50-acres.

Today, Mr. Erwin operates a 200-acre farm of which he owns 117 acres. He lives in an attractive, comfortable home, and has reared and educated six of his nine children; three of his children are still in school.

Farmer Erwin's formula for success is simple: "Don't count on any one crop to carry the whole farm load," he says, "If you are not sure what to plant, call on your county agent and tell him your problem." And he follows his own advice. County Agent B. J. Pryor

THOS. P. COOPER AND JAS. LEMMON REAPPOINTED TO CO-OP BOARD

Washington, D. C. — Thomas P. Cooper, Dean of the College of Agricultre of the University of Kentucky, and James H. Lemmon of Lemmon, S. Dak., have been reappointed directors of the Central Bank for Cooperatives, Washington, D. C., for 3-year terms, by I. W. Duggan, Governor of the Farm Credit Administration, the United States Department of Agriculture announced today.

The Central Bank for Cooperatives extends credit to farmers' marketing and purchasing and business service cooperatives throughout the United States. It operates under supervision of the Farm Credit Administration.

Dean Cooper has been a director of the Central Bank for Cooperatives continuously since it was organized in 1933. He has also served as director of the Farm Credit Board of Louisville, Louisville, Ky., since 1934.

Appointment of Mr. Lemmon was made from persons nominated by cooperative associations which are borrowers from the Central Bank for Cooperatives.

Director Lemmon, an extensive sheep operator in South Dakota, has been prominently identified with farmers' cooperative associations for over 25 years. He is president of the National Wool Marketing Corporation, Boston, which he helped to organize in 1929, and a director of the National Council of Farmer Cooperatives. This is Mr. Lemmon's fourth consecutive appointment as a director of the Central Bank for Cooperatives.

Hunter Beware Color -Blind Nimrod, Says Optometrist

Wear Clothes Contrasting with Background, and "See Before You Shoot"

"Be sure you see before you shoot."

That is the slogan recommended by the American Optometric Association for every hunter.

Failure to see properly, either because of carlessness or inefficient vision is the cause of most hunting accidents, according to Dr. Elmer M. Soles, McKeesport, Pa., optometrist who is director of the A. O. A. Department of Public Information.

"Most visual problems of hunters can be corrected by glasses or visual training—scientific eye exercises." he said. "Even if you have a deficiency which cannot be corrected it is important to know about it so that it may be compensated for as nearly as possible.

"Have your vision examined and follow the advice of your vision specialist. Proper attention to seeing will not only make you a safer hunter but a successful one.

Guard Against Color Blind

"To protect yourself from other hunters, wear clothing which contrasts rather than blends with your surroundings.

"Camouflage technique learned during the war indicate that bright orange or yellow is better than the conventional fox hunter's red, but colors may not always help because about 8 per cent of all men are color-blind. A hunter is safest from color-blind hunters if he wears a coat or cap with a bold pattern such as large black squares on a white background, or vice versa,"

Among the chief requirements of good hunting vision, according to Dr. Soles, are the following:

Near-point acuity—ability to see clearly with each eye individually and both together at a distance of 15 to 30 inches.

Distant acuity—the same as above for a distance of ten yards or more.

Depth-perception—ability to see objects properly in their space relationships.

Adequate field of vision—ability to see over a large area while focusing on a small target.

Accommodation—ability to change readily from near to far or far to near.

To see properly, a hunter's eyes should work well together like a good team of horses, Dr. Soles. Technically this is "binocular coordination," which he said, is often best acquired by visual training.

Good Citizen

The work of a utility company doesn't begin and end with the production and distribution of electric power to all who want it. The typical utility is one of the most potent and aggressive factors in carrying on worth-while community activities.

A recently completed survey shows that 94 per cent of all the operating power compaines of the country maintain a direct and intimate relationship with community organizations including chambers of commerce, civic clubs, the churches and schools, social and welfare groups, and so on. And the same survey finds that 66 per cent of the companies work through other agencies in the community in helping to bring in new industry and to strengthen already established concerns.

The utility, in short, is simply a good citizen. It knows that its own welfare and progress depends upon the welfare and progress of the com munity and the region in which it does business. It prospers when labor, agriculture and other industry prospers. And it suffers financially when they suffer.

The utliity is a mainstay of the community in other ways. It is among the biggest and most dependable taxpayers. Every tax-levying body—the town, the country, the school district, the state, and the national government—gets its share. This is in contrast to the socialized systems, which pay little or nothing in taxes, which are dominated by political considerations, and which obliterate state and local control of a vital industry.

New Artificial Unit Organized at Wincrester

A new artificial dairy breeding association has been organized at Winchester in Franklin County, according to Lynn Copeland, district dairy specialist.

Breeding services will start there about November 1. There are now 18 such county units in Midle Tennessee.

Last month more than 1,300 cows were bred by this method, representing an increase of more than 100 per cent over September of last year.

September is ordinarily a light month for breeding cows Copeland said.

The number of cows according to breed were: Jerseys, 1,060; Guernseys, 114 and Holsteins, 68.

Sumner County led the list with 169 services, Lincoln 133, Robertson 126, Bedford 105 and Davidson 99. Maury county was first in the 60-day non-returns on first services with a record 79.3 per cent.

State Will Have Less Strawberries in 1949

Tennessee will have 11 per cent less native strawberries to eat next year, the Federal and State Crop Reporting Service predicted today.

The service said reports indicate that only 7,000 acres will be available for commercial harvest next year compared with some 8,500 acres this year. Dry hot weather this summer and high labor cost are credited with the decrease.

Meat and Homes

Some people are unable to buy as much meat as they would like. Some people cannot build homes because of record prices for labor and supplies. During the depression steers on the hoof sold for as little as six cents a pound, and hogs went for three cents. There were people then who could not buy meat or build homes, even at rock-bottom prices. Then, as now, supply and demand were the controlling factors in establishing prices—and it is always true that families in the lower income brack ets are constantly confronted with the problem of how to make both ends meet.

Wages and employment are at record levels. This has generated a tremendous demand for meat. The supply of meat has not kept up with that demand. Last year the feed crops were relatively short. As a consequence, livestock numbers were reduced. The marketing of beef cattle in 1948 has run well below the level of 1947. The point is that for several years we have been eating our beef cattle faster than we have produced them. Meat animals aren't machines that can be swiftly made in any desired quantity on a production line. It takes months and years to ready stock for market and no efficiency expert has found a short cut. When demand tends to be greater than the supply, high prices are inevitable.

A reimposition of price controls would discourage production, and probably bring about an acute meat shortage. Much of the available meat would be diverted into the black market. And the lower income customers would be worse off than ever.

Increased meat production is necessary. It will come eventually. In the meantime supply and demand establish the prices at which meat is sold in our free market, and it is folly to blindly ly condemn farmers, packers, or anyone else.

Georgia Jersey Produces 10,241 Pounds of Milk

A registered Jersey cow, owned by J. L. Hutcheson, Jr., of Rossville, Ga., has completed a production record of 10,841 pounds of milk and 570 pounds of butterfat.

This cow was one of the outstanding entries in the 43rd annual Tennessee State Fair.

The record qualifies Ena Wondrous Sparkle for the silver medal award of the American Jersey Cattle Club with headquarters at Columbus, Ohio.

Sparkle's record was made on 288 days of production at the age of three years and one month.

Tennessee shipped 1,302 cars of cabbage, 689 cars of tomatoes and 417 cars of strawberries during the past season, according to the U. S. Department of Agriculture.

More Grain and Less Hay Advice to Calf Feeders

Feeder records for 1948 calf projects tell a good story. This was brought out by State Leader, J. R. Otis. A letter to all County Agents includes these facts.

He pointed out that feeders who used more grain and less hay had big profits. He found out also, that when more hay was fed the daily gains were less.

The big job is to give the calf as much grain as you can get him to eat. If you can grow most of this grain you should. You will make more money.

For good health during feeding period some hay must be fed. See that this hay is of high grade. Hay with a green color is best. Hay with plenty of leaves should be used. Alfalfa, sericea lespedeza or good pea vine is good. This you can grow.

Dr. Otis said that no boy or girl should lose money on a calf project. The time to begin is now. High daily gains over a larger feeding period will pay off.

Everybody can't have the Grand Champion. Yet everybody can have a high labor income if they will follow these points, stated Otis.

The gress is dead. Fires won't stop unless somebody fights them. Farmers should plow fire lanes before burning to prevent fires from spreading to the woods.

CHOICE WORSHIP SERVICES AND PLAYS

A book that fits in with the urgent needs of the present day. Written by various authors familiar with church requirements. Among its contents are several choralogues: The Woman at the Well; The Nativity; The Prodigal Son; etc. Tribute to the Rural Church is a beautiful tableau. The Little Church of Childhood is a plea for the continuance of the rural church. The Melting Pot is a patriotic number climaxing with the church's contribution to the country. Others are for Lord's Day observance and general occasions. A valuable book. 40c.

PLANS AND PROGRAM BOOK

Here is a collection that will provide an abundance of program material to those entrusted with the responsibility of preparing suitable programs for socials, Sunday School entertainment, Young People's Societies, etc. It is a book for many occasions and contains 142 pages

Price 60c per copy

OUR NEWEST AND MOST POPULAR SONG BOOK

68 Virginia Colored Homemakers Convert Lamps from Oil to Electricity

As a result of the further extension of Rural Electrification Administration lines in Virginia, many rural women have been faced with the problem of obtaining electric lamps to replace their old oil burners. To help solve this porblem, Miss Ruth Jamison, house furnishing specialist of Virginia State Extension Service, is conducting demonstration clinics in converting lamps from oil to electricy, e-ports Ross W. Newsome, Extenson State Agent.

Following a recent clinic in Nottoway County, a few miles southwest of Richmond, 68 colored homemakers in that county converted their oil lamps to electricity; 18 others repaired their electric lamps; and 10 made-over old lamp shades.

The house furnishing specialist conducted her demonstration clinic before neighborhood leaders who, in turn then conducted similar clinics for the women in their respective communities.

Plan Ponds Now

Farmers who desire ponds should make plans now for construction. Fish for stocking the pond may be obtained this fall, winter, and spring. This means that the fish will get off to a good start for next year's growing.

"I'm S-T-R-E-T-C-H-I-N-G my crop profit!"

"I get $4 for every $3 by 'planting' in U. S. Savings Bonds"

"The money I'm putting into safe, sure U. S. Savings Bonds today will come in handy when the time comes for me to start taking it easy."

"Ma's looking forward to that modern kitchen she'll have. New furniture, too, when those 'E' bonds start paying off $4 for every $3 put away."

"When Jimmy graduates high school and gets ready to go to college, I'll know the money will be waiting. I'm salting it away in Savings Bonds now."

"Best of all, I know my farm and my home both will have a backlog of security which will later on make it possible for me to expand and modernize."

Coal Ls a Competitive Fuel

A factual study of the economic position of the coal industry has this to say: "The high rate of output of bituminous coal which has prevailed during and since the war should not be allowed to obscure the very serious tendencies of rising costs. Rapidly rising wages are not the only consideration. High wages could be paid without lasting serious effects on labor costs, prices, markets and competitive position of the industry, if the man-hours required per ton were reduced rapidly enough. But this has not been the case." The study goes on to point out that costs must be reduced thru better equipment and methods with the emphasis on mechanization, and that this in turn is dependent on adequate earnings to finance improvements.

This is an economist's way of saying that high wages in the coal industry must eventually be offset by greater man-hour production in order to prevent coal from pricing itself out of the competitive market. And production can be increased by two methods only. One is by the use of more and better machinery—by more efficient tools. The other is greater effort on the part of the miners themselves.

It is certainly in the interest of the miners, as it is in the interest of the public, that coal production be made more efficient. They receive higher wages than any other comparable group and, save in time of strikes, steady employment is assured. This condition can be continued only if coal can keep its markets—both now, and on some future day when other fuels may be abundant and competition will get tougher. A healthy coal industry is a must for this country.

It's Been Tried Before

Some years ago Mary G. Lacy, an employee of the Department of Agriculture, wrote a little study called "Food Control During Forty-six Centuries—a Contribution to the History of Price Fixing." It has recently been reprinted, and it should be required reading for anyone who still thinks that the government, by fiat, can successfully control the distribution of goods and the prices at which they are sold.

Attempts at food control are almost as old as history. It was tried in Egypt in 2800 B. C., and the end result was a system of land tenure under which the land became the personal property of the king. It was tried in China and Athens and Rome. Much later on it was revived in England, Belgium and other countries, always with a singular lack of success. And, though few Americans know it, price-fixing was attempted in this country during the colonial era, and totally failed to remedy the problem it was supposed to cure.

As Miss Lacy sums the matter up, "The history of government limitation of price seems to teach one clear lesson: That in attempting to ease the burdens of the people in a time of high prices by artificially setting a limit to them, the people are not relieved but only exchange one set of ills for another which is greater."

When price control was tried four thousand years ago it led to a decline in production, to the withholding of goods from a market which was no longer profitable, and to a raging black market. It did exactly the same thing here when it was continued for a time after the last war. Only a free enterprise economy, in which manufacturers, farmers and retailers must compete for business can produce abundance And only free competition, all the way from the source of raw materials to the stores in which finished goods are sold, can establish a price which is fair, and, is based upon the going cost of doing business.

Take cotton to the gin dry and free of foreign material to insure the highest possible grade.

Prosperity That Endures

Socialism, according to its partisans, is supposed to produce the nearest approach to an earth-bound Utopia, in which everyone will have more of everything, in return for a minimum of work.

However, in practice, even socialism can't rid itself of economic laws wrich have existed since man first organized a society. An excellent example of this has occurred in England, where Sir Stafford Cripps, the tough-minded leader of the Labor government's economic program, recently told workers that greater production must precede greater rewards. He said, "There is only one way by which we can, with a given volume of employment, increase our real standard of living and that is by each of us producing more, or, in other words, putting up our productivity. There is no other answer." He then said that a proposal for increasing wages by cutting into corporation profits made no sense, and pointed out that the profits amounted to next to nothing when compared with wages and salaries.

American labor, fortunately for its freedom and its welfare, has so far been spared from the blight of socialism that has produced inertia and boundless red tape in England. But Sir Stafford Cripps' remarks apply with equal weight to labor in the United States or anywhere else. One of the main reasons for inflation in this country is that labor has sought—and gained—ever increasing pay, even as large segments of it have by one means or another reduced individual output. A few labor leaders have themselves pointed to the dangers of this policy, and it is to their great credit that they have done so.

It may be old-fashioned to speak of an honest day's work for an honest day's pay. But the principle that represents was largely responsible for the growth of his country from a colony to the world's foremost industrial power in an incredibly brief period of time. We produced. We got the goods out in an ever-increasing volume. And we earned the highest standard of living in the world by doing it.

The theory of less and less effort for more and more money has been tried, and it has benefited almost no one. What counts isn't the number of dollars in the pay envelope, but what those dollars will buy. The responsibility of American industry is to give labor the finest possible tools to work with. The responsibility of labor is to make those tools do the best possible production job. Then we can create the kind of prosperity that endures, and gives everyone more of the good things of life.

Aged Farmer Turns from Cotton to Year-Round Beef Cattle Program

Beef cattle and year-round grazing helped solve the problem of David Isaiah, 78 year old farmer. Isaiah lives in the Cecil community in Montgomery County. When he was young he was a big botton producer. Because of illness, old age and the labor shortage, he had to stop growing cotton.

J. T. Alexander, county agent, reports that Isaiah took kindly to his advice to change over to beef cattle. Land on which cotton once grew is now growing baby beef. Isaiah began with five grade cows in 1946.

He fertilized and limed his pasture land and seeded his bottom land to Caley peas. As fast as he could get fed in the form of pasture he has increased his herd. His herd of brood cows is now 28. He has a registered Hereford bull and plans to add more brood cows to his herd.

Isaiah looks after his cows and does what he can to help the man who takes care of the crop. All feed fed to his cattle comes from grazing and hay crops raised on his farm.

Ross C. Owen,

(Continued from page 1)

physical education at Tuskegee, Owen also coaches swimming and track.

Between 1921 and '25 he was a star halfback at South Dakota State college. Owen holds a master's degree in physical education from the University of Michigan and spent this year at New York university working on his doctorate.

T. M. Campbell, field agent of Extension Service and director of the camp, says that the presence of Mr. Owen at the encampment provided the 4-H delegates with a fine opportunity to learn more about the development of a good recreation program—a service vitally needed in many rural areas.

Meat Is Important in Reducing Diet

In all reducing diets, meat plays an important part. Meat's protein is of the highest quality and at the same time the caloric content of meat is relatively low. Unless the reducing diet includes sufficient protein, the vital functions of the body, such as tissue repair, blood regeneration, and resistance to infectious disease, will be affected. Lean meat should be the hub of the reducing diet, around which the meals for the day are planned. Lean meats include steaks and chops, roast lamb, veal, and beef from which all fat has been trimmed. Ground beef patties, made from lean beef, also may be included in the reducing diet.

Chopped fresh or canned mushrooms are an excellent addition to condensed tomato soup. The combination may be used as a soup or a sauce.

Many points could be given to justify killing all roosters that are not needed for breeding purposes, states John E. Ivey. Poultry Specialist. Only three points however, will be considered here.

(1) It will save a lot of good feed.

(2) It will prevent a large supply of low quality fertile eggs going to market.

(3) It will help with our winter meat supply if you will can your roosters.

Facts Announced

(Continued from page 1)

A special form of loan agreement will be available to cotton cooperatives marketing associations whereby the association may obtain a loan on cotton on which such associations have made loans to their producer-members.

The county agricultural conservation association committees in the various States will designate persons as clerks to assist producers in preparing and executing loan papers. Bona fide employees of production credit associations chartered by the Farm Credit Administration, of banks and other agencies approved by CCC as lending agencies, of warehouses approved for the storage of loan cotton, and county agricultural conservation associations employees will be designated as clerks. Employees of other groups, such as cotton factors, ginners, cotton buyers, or others who have adequate facilities to perform the services required of a clerk, may also be approved upon the recommendation of the county agricultural conservation association committee to the State Production and Marketing Administration Committee.

The schedule showing mill area and variation in loan rates for the zoned areas follows:

Schedule Showing Mill Area And Variations in Loan Rates For the Zoned Areas

I. Designated Mill Area:

North Carolina: All counties west of Granville, Wake, Harnett, Hoke and Scotland.

South Carolina: All counties west of Marlboro, Darlington, Lee, Sumter, Calhoun, Orangeburg, and Barnwell.

II. Zoned Area Based on Mill Area:

Area 7 Points Less Than Mill Area:

North Carolina: All counties east of Person, Durham, Chatham, Lee, Moore, and Richmond.

South Carolina: All counties east of Chesterfield, Kershaw, Richland, Lexington, and Aiken.

Virginia: All counties.

Area 10 points less than mill area:

Georgia: All counties east of Union, Lumpkin, Dawson, Forsythe, Gwinnett, Walton, Morgan, Putman, Hancock, Glascock, Jefferson, and Burke.

Area 17 points less than Mill Area:

Georgia: All counties, except Dade and counties in zones with 10 points less than mill area, north of Stewart, Webster, Sumter, Dooly, Wilcox, Telfair, Wheeler, Montgomery, Toombs, Tattnall, Evans, and Bryan.

Area 26 points less than Mill Area:

Georgia: All counties south of Chattahoochee, Marion, Schley, Macon, Houston, Pulaski, Dodge, Laurens, Treutlen, Emanuel, Candler, Bulloch, Effingham, and Chatham and north of Quitman, Randolph, Calhoun, Baker, Mitchell, Colquitt, Cook, Berrien, Atkinson, Ware, Pierce, Brantley, and Glynn.

Area 27 points less than Mill Area:

Tennessee: All counties east of Marion, Sequatchie, Bledsoe, Cumberland, Morgan and Scott.

Georgia: County of Dade.

Alabama: All counties east of DeKalb, Marshall, Blount, St. Clair, Shelby, Coosa, Elmorc, Macon, Bullock, and Barbour.

Area 35 points less than Hill Area:

Georgia: All counties south of Stewart, Webster, Terrell, Dougherty, Worth, Tift, Irwin, Coffee, Bacon, Appling, Wayne and Mcntosh.

Florida' All counties east of Jack son, Liberty and Franklin.

Area 36 points less than Mill Area:

Tennessee: Counties of Marion, Sequatchie, Grundy, Bledsoe and Cumberland.

Alabama: Counties of DeKalb, Marshall, Blount, St. Clair, Shelby, Coosa, Elmore, Macon, Bullock, and Barbour.

Area 45 Points less than Mill Area:

Tennessee: Counties of Franklin, Coffee, Warren, Van Burean, White Putnam and Overton.

Mitchel E. Erwin

(Continued from page 1)

says that whenever Mr. Erwin runs into problems, he comes by for help. Not only does he make good use of the information in handling his own crops, but as an Extension Service community farm leader, he also passes it along to his neighbors.

As for one-crop farming, Mr. Erwin learned his lesson 30 years ago. He is a confirmed believer in diversification.

His cropping program in 1946 was as follows: 14 acres of cotton, 15 acres of corn, 15 acres of watermelons, 35 acres of sweetpotatoes, four acres of roses, a half-acrc garden, 20 head of beef and dairy cattle, nine hogs, and 100 chickens.

When asked how much he grossed last year, Mr. Erwin replied, "Well now let's see; you add it up." Then he cnumerated: Sweetpotatoes, $5,700; fuel wood, about $2,500; melons, $1,000, and cotton $400.

Pointing to his roses, Farmer Erwin said, "I didn't sell any roses last year. You see, I stopped growing roses about four years ago; just got back into them last year. The way we grow 'em it takes a couple of years to get a crop. However, by planting a new crop every year, you can harvest a crop every year, that is, after the first year."

Asked how much he expected to gross from the rose crop he said, "Oh, I'll sell about $50,000 plants, you know, the kind you city fellows buy at the Five and Ten Cents stores to set out in your yard. For my plants I expect to receive about 10 cents each; that means the 50,000 will bring about $5,000."

Not only do the Erwins have a diversified farming program, but they live at home, too; grow their own meat, and vegetables, and produce their own eggs, milk, and butter. Last year, Mrs. Erwin canned 400 quarts of food, and Mr. Erwin cured cnough pork to last throughout the year

If this is a bear the Erwins have by the tail, many other Texas farmers would like to have a bear like it And, like the Erwins, they certainly wouldn't let it go

Heavy Grain Losses

Insects destroy at least $5,000,000 worth of corn and other grains in Alabama each year. Most of this grain could be saved.

Steps to be taken in preventing this loss are (1) harvest early; (2) clean crib or storage space before new crop is stored; (3) fumigate grain in storage.

Alabama: Counties of Madison, Jackson, Morgan, Cullman, Jefferson, Bibb, Chilton. Autauga, Montgomery, Pike, Coffee, Dale, Henry, Geneva, and Houston.

Florida: Counties of Bay, Calhoun, Gulf, Holmes, Jackson, Washington, Liberty and Franklin.

Area 54 points less than Mill Area:

Tennessee: Counties of Lincoln, Giles, Moore, Bedford, Marshall, Rutherford, Cannon, DeKalb, and Wilson.

Alabama: Counties of Limestone, Lawrence, Winston, Walker, Fayette, Tuscaloosa, Hale, Perry, Dallas, Lowndes, Butler, Crenshaw and Covington.

Florida: County of Walton.

Area 63 points less than Mill Area:

Tennessee: Counties of Lawrence, Wayne, Lewis, Perry, Hickman, Humphreys, Dickson, Davidson, Williamson, and Maury.

Alabama: Counties of Lauderdale Colbert, Franklin, Marion, Lamar, Pickens, Greene, Sumter, Marengo, Choctaw, Wilcox, Monroe, Clarke, Washington, Esambia, and Conecuh

Florida: County of Okaloosa.

Area 73 points less than Mill Area:

Alabama: Counties of Mobile and Baldwin.

Florida: Counties of Escambia and Santa Rosa.

Charles L. Fussell Of

(Continued from page 1)

president of Georgia State college and founder of the Association for the Advancement of Negro Country Life which sponsors the jamboree.

"I realize that my conservation program is only half complete," said Mr. Fussell as he received the top award, "and I am going to keep right on working toward the end of making my farm the best—not only the best colored conservation farm in the South, but a farm which will equal or exceed any for its size any place."

State champion winners at the colorful jamboree were: Otho McKinney of Clanton, Ala.; Dave Evans of Emmet, Ark.; Andrew Carman of Mayfield, Ky.; John P. Harris of Polkton, N. C.; C. A. Nunn of Fallis, Okla.; Thomas McElrath of Woodruff, S. C.; Melmoth Ragland of Denmark, Tenn.; J. W. Smothers of Brownsboro, Texas; and George Yates of Boyd's Tavern, Va. Each was awarded a prize of $100.

Principal speakers at the jamboree were Miss Susan Myrick, farm editor of the Macon, Ga., News and Telegraph; T. H. McGibboney, a supervisor of the Piedmont Soil Conservation District; and Loy E. Rast of the Southeastern Regional office of Soil Conservation Service.

During the jamboree, each conservation winner was asked to make a statement about how he had protected and built up the fertility of his farm. Their statements were stories of triumph symbolized by the jamboree. The winner related how they had started out on poor, eroded land and with the help of their soil conservation districts had increased its foreility and its yield, thereby raising their own standard of living.

For example, Mr. Harris of North Carolina pointed out that when he bought his 55-acre place 12 years ago, it was known as "the forsaken farm." The house was run-down and his fields were gullied. The first year or two his corn yield on the patches between the gullies was only five bushels per acre and his lint cotton yield was 125 pounds per acre.

"Now as a result of assistance from my soil conservation district, I am growing four times as much corn and twice as much cotton," Mr. Harris told the jamboree audience. Then he added, "It's easier, too."

Mr. Evans of Arkansas related a similar experience. Said he, "After learning something about soil conservation as a tenant farmer, I decided that could start out for myself. In 1942 I began buying a run-down, eroded farm. At first yields were low, but by carrying out the conservation practices I had learned as a tenant and by getting additional help from my district, I was able to build up my farm.

"My lint cotton yield jumped from less than 200 pounds per acre to nearly 300 pounds. Also my corn production increased and my pastures paid off in fatter livestock. The larger income from my higher yields has enabled me to build a modern home with electric lights and running water."

The stories of the other winners were about the same. They were saga of achievement in the face of difficulty.

"This jamboree is beginning to make itself felt,'" said Dr. Hubert who started the event on a local basis four years ago. "It is our purpose," he declared, "to help focus attention on the need for more farmers to carry out sound soil and water conservation practices as the first fundamental steps toward real prosperity."

This year, for the first time, Dr. Hubert and his association, chose a Southwide soil conservation champion. Last year they selected only state champions.

$70,000 Earned From

(Continued from page 1)

Edwards, 17, of Meridian, Okla., is second with $904.10; and Miss Annie Belle Walker, 19, of Prescott, Ark., is third with $638.49. The total reported earned by all of the 86 delegates to the encampment is, $71,5534.75.

The youths made their earnings off livestock, poultry, peanuts, cotton, sorghum, truck gardens, clothing projects, and from State and district prizes. For example, Marcus of Georgia made his $7,000 over a nine year period from beef cattle hogs, and corn. These brought him earnings and prizes ranging from $250 in 1939 to $1,280 in 1946. During the war, Marcus organized his local 4-H club into farm labor groups to help hard pressed farmers harvest peanuts to help meet critical vegetable oil shortage.

Miss Gillespie of Tennessee, who leads the girls in earnings from her 4-H work, has completed 55 projects during the seven years she has been a 4-H'er. Most of her $1,073.15 in earnings has been in the form of savings in food and clothing for the 16 members of her family. Her projects have consisted mostly of growing and canning vegetables, making over and repairing clothing, and of raising chickens. She has won first prize awards in clothing and canning. On April 30, she was graduated from high school. Miss Gillespie was one of six delegates to the encampment from Tennessee.

Other states sending delegates were as follows: Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, Missouri, North Carolina, Oklahoma, South Carolina, Texas, Virginia and West Virginia. All states sent six delegates except Maryland, Missouri and West Virginia which sent four, two and two respectively.

Farm Labor Offers Cheapest Electric Power

A recent release by the Associated Press points out the benefits of electric power to farm families. It points out that electricity can do work cheaper than hired hands. The increased output provides a greater margin of profit.

It stated that a farmer can do as much for 18 cents with electricity as a hired man can do in an hour for 64 cents. For 5 cents worth of "juice" the farmer can shell from 20 to 30 bushels of corn. He can milk from 10 to 20 cows. He can pump 1000 gallons of water.

Among other things, for 5 cents, he can mix two ton of feed and churn 10 pounds of butter. Farmers who can get electric power will do well to make the greatest possible use of it. These comparisons should be eye opener to our farmers.

Poultry Tips

Feed is high. You can't afford to keep loafers in your laying flock. Cull poor layers every month to save precious feed and keep up production. This will add to your income.

Gather eggs two or three times per day. Cool quickly, store in a cool place. Market at least twice a week .

Select hens for market as they go out of production. Sell all roosters and low quality pullets.

PEANUTS

For best grades of peanuts dig when veins in hulls turn dark and vines begin to turn yellow. Stack right on good poles so a good job of curing can be done.

Plant oats to help insure a grazing supply. Get them in early.

Save all the hay that you possibly can.

November, Early December Best Time to Plant Trees

By Dr. Floyd Bralliar,
Garden Editor,
The Nashville Tennessean

November and early December constitute the best period in the entire year for setting out fruit trees and really hardy shrubs.

If you are planning to plant any of these things this season, get in your order at once, and get the soil ready for planting before your trees or shrubs arrive.

These autumn days, the homeowner is apt to forget the water requirement of shrubs and trees, in fact he may not even know they need water. It is important to see that all trees and shrubs get all the moisture they need right up to the time that real winter sets in.

Give Off Moisture

All trees and shrubs give off some moisture into the air, even in the coldest weather of winter. The principal reason for trees and shrubs to die during the winter is that they did not get enough moisture in the fall and so could not make normal preparations for winter. We have had an extreme drought for months over the territory where most of our readers live, and so far we have not had enough rain to wet the ground thoroughly.

This is especially true of evergreens, for they retain their foliage throughout the winter and require a good supply of moisture to prevent drying out. It is advisable to water them as long as the soil will absorb the water or until our real rainy season sets in.

During the dry times, or in the winter, trees with deep-growing roots can secure all the moisture they need from the deep soil. But we have had such an exceptionally dry summer and fall, if we owned a tree that we especially prized no matter what its roots habits were, we would give it at least one good soaking if we could do so.

Mulch With Leaves

Shrubs and young evergreens are especially apt to need water: they not only need frequent and thorough waterings before cold weather actually sets in, but the young evergreens, especially boxwood, no matter what its age, should be mulched two or three inches deep with well-decayed leaves, peat, cotton-seed hulls or similar material.

This much should cover the ground under the limbs and extend from the trunk outward as far as the tips of the branches. This mulch is not needed by many of the shrubs, but it is best to keep it on all evergreens the year round, for it keeps the soil from drying so rapidly, and furnishes a uniform temperature to the soil.

In watering any plant, especially during the growing season, be sure to use enough water to soak the soil deeply enough to reach the moist earth from beneath. Shallow watering encourages the plant to make roots too near the surface, while thorough watering encourages deep rooting.

Advice on Boxwood

Every spring readers want to know what is wrong with their boxwoods and other small evergreens. They seem to be dying. In most cases the trouble is that they were not properly mulched and watered.

Their leaves continue to throw off water all winter long, and the roots could not supply enough to take its place, so the most active, young boxwood died, not because of a disease or cold weather, but from lack of enough water.

November and early December are the best times to set out lilacs anywhere south of the Ohio river, even in the highest mountains, and extending as far south as lilacs will grow. And the French varieties are by far the best varieties to grow. Plants three or four feet tall, of almost any of the French variety, if set in the fall, can be expected to show bloom next spring, and then the spring after that.

Fall Planting Advocated

The American Association of Nurserymen, "Fall planting will minimize various hazards, and if a few simple precautions are taken, you may have hybrid French lilacs as glorious as a nurseryman's dream and a florist's delight. Select a location which provides rich sweet soil, full sun, and ample currents of air on at least two sides. When planting set them in the ground slightly deeper than they grew in the nursery.

The French hybrids, with their artistic growth and limited canes can be easily protected from borers by encouraging the best growth possible, by giving them a perfect location, and keeping a sharp eye out for intruders. Borers are readily spotted by their sawdust trail, and a wire shoved into the burrow will usually dispatch them.

Hybrid French lilacs are in a class by themselves for charm, color and elegance."

Should any of our readers have lilacs that they wish to transplant, this is the best time to do the job. Properly transplanted at this season, and kept well watered ext spring and summer, very little, if any, pruning is necessary, and the plants should bloom next spring.

We believe that every family that can possibly do so, should plant a home orchard. We will discuss this rather fully next week.

Should any of our readers have any questions on the care and culture of fruits, flowers and vegetables, especially the flowers and vegetables, send them in at once and they will be promptly answered. Enclose a self-addressed stamped envelope, or just a stam with your letter of inquiry.

Animal Tails

By F. J. Worrall

In the animal kingdom there are all sorts of tails—they may be fat or thin, long or short, perhaps or nonprehensile and they all vary in appearance, according to use or need. The uses of some are obvious, others are obscure. Thus, the fat tail is a food store analogous to the camel's hump. That of the beaver is used as a paddle to propel him through the water; there is also a belief that he uses it to plaster mud on his dwelling or lodge but this story has no foundation.

The tail as a balancer is often seen in the domestic cat as it walks along the narrow margin of a top fence. Its tail twitches from side to side to retain an even balance; invariably a cat's tail is also an index of its mood.

A dog running at high speed always makes use of its tail as an aid in changing its course; it is also used as an index of mood—whether it be joy or deep dejection.

Opossums possess a highly prehensile tail. With those species in which a pouch is absent, the young ones are conveyed upon the back of the female, who holds her tail over her back so that her infants may cling to that member with their own prehensile tails, a sort of straphanging device that combines safety with efficiency.

The Ring-Tailed Lemur uses his long and handsomely ringed appendage to complete his toilet—and at the same time uses it as a cushion to sit upon.

It is not known generally that the lion's tail, which ends in a bushy tuft of hair, conceals a small spur-like growth, or "nail." The utility of this is unknown. Small kangaroos possess a similar spur at the end of their tails.

The most highly prehensile tails among reptiles are those of the chameleons. On the move these creatures use their tails as additional hands or feet, put when at rest the memper is coiled in close spiral.

The tail of the scorpin is highly flexiple. Armed with poison glands, it is capable of inflicting a dangerous sting.

The stump-tailed lizard, native of Australia, has a tail so nearly resembling his head that he was formerly thought to have two heads and was known as a Two-Head Lizard. Before it hibernates for the winter, it eats heartily and accumulates a large amount of fat upon its tail, thus providing for scanty times. The fat-tailed Gecko, which feeds on insects and grub, is another lizard that stores fat in its tail.

Here's Few Tips on Best Ways to Prepare Burley for Market

U. T. Extension Service Tobacco Speciaist

Another crop of golden week—burley tobacco—has been grown, harvested and cured. Now the golden leaves await the hands of the stripper. All tobacco growers are confronted with major problems, namely: (1) growing the plants, (2) harvesting, cutting, hauling and housing, (3) curing, (4) preparation for market anl (5) marketing.

The first three problems are now behind the growers. Choice fine, good, fair, or low grade tobacco now hands in the curing barn—the degree of quality depending on the attention given it by the grower, climatic conditions that prevailed during the growing period, nd the character of the soil on which the crop was grown.

Now, the only place left n squeezing out a few extra dollars to buy the wife a new dress, a new pair of shoes for the son or daughter, or to get a few more dollars to use in buying gasoline for the auto is in the preparation-for-market, that is, in the sorting of the leaves, tying of the hands, pressing, and the methods resorted to after the hands have been tied.

Growers coming down through the long lane of burley tobacco history by the trial and error route have found the following methods of preparation and delivery to be best:

(1) After stems and stalks have dried, catch the tobacco when it is in a flexible, not too soft condition on a damp morning—(a) pass or drop off tier-pole, (b) remove from sticks, an armload at a time, (e) bulk in a two-course bulk, lapping the tails, in midde, (d) strip in a warm air current-free room over a wide table placed in a good light, preferably admitted from the north, (e) strip and sort by the relay method—moving stalk as grade is pulled across the table from one stripper to the next until all grades have been pulled.

Two, three, four or five strippers may be used at a table. Where five work at a table, each stripper pulls one grade. It is the duty, however, of stripper No. 1 and o. 5 to keep tobacco on table, tied hands pressed, bulked and stalks removed from stripping room. Where the relay method is practiced each stripper ties his or her own tobacco and places each hand, as tied, across a tobacco stick, and where only two people work, one pulls flyings and trash, lying fixings on table and holding more solid (non-stemming) leaves in is hand and the other pulls the lug leaves—the cream of the crop.

Later the two pull the bright leaf, red leaf and tips, tying, sticking and pressing as they strip—(f) press on the stick, (g) bulk pressed tobacco, all grades together, in an open coop after labeling each stick with a piece of chalk, or notching with a knife. (h) later taking up the sticks on a "soft" morning and (i) bulking into a solid bulk for safe-keeping and later delivery.

Hanging stripped tobacco up on the tier poles is a damnable practice. It should be discouraged. When it is hung up, it loses its luster or sheen, and darkening may come about if much damp, high-temperatured weather is experienced before delivery. Thn hanging up may delay delivery one, two, three or four weeks.

Now in order to give every burley grower an opportunity to become familiar with the best methods farmers have learned by the trial and error route, the U. T. Agricultural Extension Service is bringing 10 experienced graders into the state to assist our county agents in holding preparation-for-market demonstrations on some growers' farm. The idea is to cover the state in the next six weeks, giving every grower who has a desire to improve his handling methods an opportunity to see the best at a short walk, a horse-back or auto ride. So arrange to attend one, bringing an armload of your tobacco, wrapped up in blanket.

Weeds Cost Farmers in U. S. Around $3 Billion Each Year

By Dr. Floyd Braillar
Garden Editor
The Nashville Tennessean

Weeds have been a plague to farmers and especially to gardeners ever since the fall of man.

However we should not think of weeds as wholly a curse, for without them perhaps the majority of us would not cultivate our soil thoroughly and freqently enough to keepit well mixed with air and enable it to absorb rain and hold it for the benefit of our crops.

Weeds have plagued farmers for centuries and until recent years there have been only the crudest implements not only for fighting weeds but also for prearing the soil. Modern farm power and new style equipment simplified weed control under average coditions.

Same Basis of Control

The basis of control, however, was still the same. Weeds were either pulled or cut, leaving all or part of the roots to sprout new crop of trouble. Weed control becomes increasingly costly in the face of rising farm labor costs, tractor fuel and cost of wear and tear on machinery.

Weeds harm our crops in several different ways. First, they are mostly ravenous feeders and rapidly use up the best food in the soil. Because they are rampant growers they quickly grow taller than our garden crops and so prevent them getting necessary supply of sunlight. Even more serious still, they rapidly take the moisture out of the soil which was needed by our crops.

Then besides all of this, most weeds make deep heavy roots under and among the roots of our crops, and when we try to pull up the weeds we are sure to injure the roots of our garden plants.

Big Yearly Loss

Extensive studies carried on by the United States as well as by other competent authorities show us that "the average farmer spends $350 per year in labor and equipment, especially in the control of weeds on his farm." In fact, "before the introduction of chemical weed killers the loss from weeds for the farmers of this nation was estimated at $3,000,000,000 per year." An average of $350 is spent by the average farmer every year to fight weeds. If our gardeners are particular and the public in general could realize that weeds in one way or another are taking hundreds of dollars out of every family's pocket book they would do something about it at once.

Far too many gardners only keep their gardens clean as long as their crops are producing. As quickly as any given crop is harvested the weeds are allowed to grow the remainder of the year and ripen millions of seeds. The average gardener seldom goes to the trouble of cutting the weeds down on the borders of the garden.

Many fine Eradicators

Now that 2-4-D and other weed eradicators have been discovered and put on the market everywhere, it is a simple matter indeed to keep down weeds in the borders of our gardens, and if carefully used in the garden itself. These materials are sold under the various trade names, every firm using its own name under which their product is sold. And because there are minor differences in the strength of these different products as well as in the way they are compounded it is highly important that they be used strictly as directed on the container or in literature furnished by the manufacturer.

There are certain weeds such as ragweeds whose eradication is vital to public health, for they are prime causes of hay fever. Several of the large cities of the United States have put on extensive weed killing campaigns with the determination that they will completely eradicate ragweeds from their environments in the interest of the health of the public. If it is important enough for our cities like New York and Chicago to spend hundreds of thousands of dollars in weed eradication certainly it is important to our gardners to clean up their own gardens and to do it now.

African Student to Observe Extension Work in South

K. T. Barima, a student from Gold Coast, West Africa, will observe the operation of the Extension Service program among Negro farmers here for about a month, T. M. Campbell, Extension Field Agent, announced this week.

Mr. Barima, who is a graduate of Cambridge, will travel in Alabama, Georgia, and Florida during the latter part of this month and the early part of October, observing first-hand how farm and home demonstration agents help farm people increase their production and raise their level o fliving.

Following his visit here, Mr. Barima will leave for Trinidad where he will enter the Imperial College of Tropical Agricuture.

How Carver Helped Fight Plant Diseases Reported in USDA Research Publication

The important but little known contribution of Dr. George Washington Carver to the fight against plant diseases is reported in the May 15 issue of "The Plant Disease Reporter," a U. S. Department of Agriculture publication.

As a student at Iowa State college, Carver began a lifetime fight on plant diseases by collecting and studying many species of fungi known to be plant parasites, says the publication. Joining with his professor, Dr. L. H. Pammel, an outstanding botanist, he did much of the work in the preparation of an annotated list of fungi collected and studied at Iowa State in 1895.

At Tuskegee, Dr. Carver continued collecting fungi as a hobby. Records show that he collected and annotated a list of over 1,000 species of fungi in and around the institute campus.

In 1935, Dr. Carver was appointed a collaborator of the Bureau of Plant Industry, Soils, and Agricultural Engineering. It was during the period from this time until his death in 1943 that Dr. Carver collected the greatest number of his more than 1,000 fungi species. Many of the specimens he collected proved of great significance in the fight against various plant diseases.

Number of Tenant Farmers Shows Continued Decline

A continued decline in farm tenancy which is partly reflected in increased ownership is shown by a survey made by the Bureau of Agricultural Economics of the U. S. Department of Agriculture.

The percentage of tenancy dropped from 31.7 to 26.9 percent between 1945 and 1947, according to BAE's survey which is based on a sample of about 15,000 intervie. This compares with 42.4 percent of tenancy in 1930.

In explaining the decline, BAE says that many former tenants have climbed in ownership, others have not returned to the farm since the war because they have been able to find off-farm employment. Also, there hasn't been the urge to return to farming as a result of improved agricultural technology which is tending to reduce the need for more operators.

Between 1940 and 1945, the number of non-white tenants decreased by nearly 35,000 while the number of white tenants declined by over 468,000. However, during this same period, the number of non-white owners increased by nearly 5,000, and the number of white owners, by about 258,000. Over-all, the number of farmers declined by 237,000 between 1940 and 1945. Part of the decline is explained by the presence of a large number of farmers in the armed forces and war industries during the period.

WITH HENS AND CHICKS

All pullets and cockerels should be vaccinated against fowl pox when they are from 8 to 10 weeks of age. Tthe older the birds when vaccinated the more severe the reaction will be.

Potatoes and the Moon

By Lera Knox

(Fins, Furs, and Feathers)

I am greatly flattered that Dr. Mayfield is interested in what I think about the effect of the moon on potato planting and bean climbing. However, he probably thinks that I'm having a hard time making up my mind because he mentioned the subject several days ago. But it's a serious matter, Dr. Mayfield.

My general philosophy is what can't be cured must be endured—unless perhaps it can be enjoyed. The moon is a few million miles beyond my reach and I can't do anything about it—so I just enjoy it.

As you know, I'm a very much down-to-earth person. Now, the earth is something I can really do something about. Whatever the moon may or may not do to growing crops is beyond my knowledge or remedy, but what manpower and fertilizer can do to them—that's within my scope.

I can tell you this. After I have done a good day's work putting man power and fertilizer into my garden, I'm a heap too tired to worry that night about whether the moon is dark or light.

But on the subject of the time to plant potatoes, the young bloods usually flippantly remark that they plant in the dirt and not in the moon. It's the oldest who go and hunt up the almanac.

I won't admit that I'm in either class. I sometimes wonder if more dirt and work and fertilizer are enough. Hormones, at least, seem important.

However there are times when it certainly looks like there is a difference in the growth of garden crops—and to my way of thinking all of it can't be blamed on the weather.

Here's an example, I buy my bunch bean seeds in bluk, about five pounds to a sack. I lay off rows side by side and plant one row, or maybe two. In a few days I'll plant another row and in a week or so some more—all from the same sack.

The seeds are the same, so is the soil, and the weather except for the firrt few days of sprouting and leaf ing. But at bearing time, it seems that some of the rows have more beans than others. There just seems to be a difference—one way or another.

I would never be so bold as to make the following statement, so I'll attribute it to one of my neighbors. He said that he planted half a row of potatoes one day and then took off for lunch. The moon changed at about that time of day. He went back after lunch and planted the other half. How, he swears that you could tell by the growth which part of the row was planted by the dark of the moon. However, he didn't say whether it was noticeable on a moonlight night.

I've heard people who were work ing at institutions for the mentally unbalanced say that they could notice a difference in the degrees of lunocy (lunacy is derived from the word "luna" which means "moon or light") when the moon was in different stages. This may be so, but as I said, the moon is something I don't know a thing about, whether it' made of green cheese, or whether it influences men or potatoe vines.

However, the older I get the more I think the old folks are nearer right than the youngsters about potato planting. Take that any way you like.

I do know this, I find it harder to sleep on moonlight nights and I've heard other old cranks say the same. What about you?

Colored Elevator Operator Receives Special Presentation

Mrs. Carrie Hall, colored elevator operator in the U. S. Department of Agriculture for almost 33 years, received a special presentation from Secretary of Agriculture Clinton P. Anderson upon his retirement from the post last week.

After he had shaken hands and said goodbye to most of the Department's Washington employees, Secretary Anderson presented Mrs. Hall a photograph of himself on which he had written a message. It read: "When someone has smiled at me every morning for a long time, and has been pleasant all day, I appreciate it—and so, a picture to Mrs Carrie Hall—Clinton P. Anderson."

Horse Named "George"

(A True Story)

This is a true story of two little girls and a horse named "George." It seems that during the War Between the States Mary and Milly lived in a rambling log-house down south with an older sister and their Aunt Amelia; and that one August afternoon they came into the house after the Federal cavalry had made a raid. Aunt Amelia lay on the lounge, sobbing. Something was wrong.

"Where is George, Aunt Amelia?"

"Those Yankees took him off to Carthage. I know that Miss Sallie will be heartbroken when she hears of it."

Mary and Milly grabbed their pink sunbonnets and went out the door like,—well, like two streaks of lightning let us say; but they called back: "Tell sister we've gone for George." It seems that by going "across lots" they might be able to catch up with the cavalry before it gained the Carthage Pike. But a vicious dog chased them into a yard. They shrieked and the owner came to the door.

"Oh, do come and take your dog away! For we're in a dreadful hurry."

No doubt the owner was surprised but quite ready to help them get away. At last they caught sight of blue uniforms in the distance. It took perhaps five minutes to come up near the blue cóats and Mary waved her bonnet—and the captain drew rein. So did the entire company. Milly, going up to the man in front asked: "Are you the captain, sir?" The astonished officer admitted that he was.

"Then sir, do, oh please do, give us back George" A magnificent bay nickered at the sound of his name.

"He was the only horse we had and we would miss him like he was one of our family," came the further appeal. Mary went over to "George" and fastened her fingers in his dark mane; but the young officer tried to make it clear that all such captures became General Payne's.

"But oh, sir, just thank how your own little girls at home would feel is some big, strange men were to take away their own dear horse!"

A change came into the captain's face. He turned to the man whom "George" was bearing and commanded: "Dismount and give that horse to these children!"

The captain alighted and took a blanket from under his own saddle and put it on George. Can't you picture Mary and Milly in their pink sunbonnet riding joyfully home on George's back? And don't you think they were two brave little girls?

Avoid overloading the refrigerator with food.

You should keep a stiff brush near the laundry tubs. Brushing cleans better and is easier than rubbing on a board. The brush is also good for cleaning out pockets and for brushing soapsuds onto stubborn stains.

Both time and food are lost when meats, fruits and vegetables are frozen in low quality wrapping materials. The proper equipment costs but little more.

BOYS WITH GUNS

We constantly read in the papers of tragedies connected with boys with guns, sometimes deliberate shooting and sometimes accidental, which could have been prevented if the boys had not been allowed to have guns. Our Society often receives complaints in regard to boys shooting at animals. In one neighborhood complains were received that two cats had been shot. One cat's leg was so badly shattered that it was necessary to put the animal to sleep Another cat, though shot twice, will recover.

One of our officers called on the parents of a thirteen-year-old boy, who had been shooting at animals and explained to them that the penalty for giving a minor an air gun or ammunition for it was not less than one hundred nor more than five hundred dollars. The mother promised to take the gun away from the boy.

THE COLORED

YMCA

Can Accomodate

TRANSIENT MALE PATRONS

When coming to Nashville you are requested to stop at the Colored Y.M.C.A., Fourth Avenue North and Charlotte Avenue.

The rooms are located on 3 floors. Splendid outside rooms with much of the modern conveniences.

It is located in near down town Nashville.
There are clerks on duty twenty-four hours every day.

The rents are reasonable.

If any man wishes to take permanent residence in the building, this can be arranged.

Come to the Colored Y.M.C.A. while in the city.

COLORED YMCA INCORPORATED

Fourth and Charlotte Avenues

Nashville 3, Tennessee

Better School Lunches Sought by USDA Research Center

School lunches that are more nutritious as well as tasty are constantly being sought for the 7,000,000 white and colored youngsters on the program, says the Bureau of Human Nutrition and Home Economics of the U. S. Department of Agriculture.

In an experimental kitchen at the Beltsville, Md., USDA Research Center, nutritionists of the HNHE make use of abundant foods in developing recipes for use in the school lunch program. All recipes are judged for palatability. They are tested in cooperating schools where representatives of the agency watch children's choice of menu, hear their comments, and note whether or not any of the food prepared by one of the recipes is left on the plates. Recipes which children like are published from time to time.

HNHE also seeks to learn the extent to which school lunches are meeting the children's nutritional needs. Sample lunches from cooperating schools are analyzed in the agency's laboratory to determine their content of important nutrients.

The Production and Marketing Administration, the agency in charge of the permanent school lunch program, is cooperating with HNHE in carrying out this research work.

Georgia 4-H'ers Compete for Scholarship Awards

A white and a colored Georgia 4-H youth will receive scholarship of $400 each this year for outstanding far achievement and scholastic standing in high school, reports the Georgia State Extension Service.

An impartial committee selected by the State 4-H Club Office will judge the records of 4-H'ers and determine the winners. The awards will serve as two-year scholarship aid. One hundred dollars will be given to each of the winners upon entering college this fall and $50 at the beginning of each of the other two quarters. The same plan will be followed the second year.

The awards are being presented by an iron and roofing firm of Savannah, Ga.

Prayer for Animals

We beseech Thee, O God, to hear our supplication on behalf of the dumb creation, who, after their kind, bless, praise and magnify Thee forever. Grant that all cruelty may cease out of our land, and deepen our thankfulness to Thee for the faithful companionship, of those whom we delight to call our friends; according to the loving kindness of our Lord, Jesus Christ. Amen.—DR. H. R. L. SHEPPARD.

The mass standard of living cannot be raised appreciably by redistributing what we now have; it can be raised only by increased efficiency in production and distribution of goods and services.—SAMUEL C. GALE.

Safety

Learn to recognize and hunt out accident and fire hazards on the farm and in farm homes. Correct and remove all hazards found.

Let's not forget the idea of selecting "branch heads" for use in growing our fall vegetable crops Such spots can be found on most farms.

Try to plant soil-improving winter legumes crops in September. Plant all blue lupines possible on land where peanuts were dug.

SHOPPER (after looking at everything in the department): "Thank you, but I am just looking for a friend."

DISGUSTED CLERK: "Well here's one bolt of green silk you haven't seen. Do you think she could be in that?"

Farm Credit's Loan Program Helps Farmers Get on Their Feet

How the Farm Credit Administration is helping many white and colored farmers to get on their feet is explained in reports which the U. S. Department of Agriculture receives from regional field offices.

Jesse B. Hearin, president of the Production Credit Corporation of New Orleans, describes in a recent report how farmers in his district—Louisiana, Mississippi, and Alabama, are being aided by FCA Production Credit Associations.

Among the examples given was one concerning Mr. and Mrs. Charles Williams, former sharecroppers of Louisiana, who now own a 50 acre farm, a new six-room house, and 29 head of cattle.

Mr. Hearin points out that in 1935 when the Williamses became members of the Production Credit Association of Shreveport, La., and received their first loan of $100, they were in serious financial straits. Their landlord, who had been furnishing them every year, had died and they were forced to seek credit elsewhere.

All Mr. and Mrs. Williams and their seven children owned when they applied for the loan were two calves, a horse, a sorghum mill, and sweetpotato bank with a few potatoes in it. Besides, they already had a small debt.

The Production Credit Association helped them budget their loan so that they received it in installments as needed. This not only assured funds until harvesting time, but it also reduced the interest on their loan. Interest on such loans is charged only for the period the borrower actually has the money in use, and not for the whole period during which it is available.

By carefully budgeting their own income as well as loans from PCA the Williamsons were able to pay off all their old debts by 1938, and were growing sweetpotatoes and sugarcane as important sideline crops in addition to their cotton.

The next year, they bought 20 acres of good hill land, and added another 30 acres to it in 1940. By last fall, the Williamses had paid for their land, built and paid for a modern six room home on it, and were helping their oldest son, a veteran of World War II, buy an adjoining farm. Also, they were sending a daughter to college and the other five children to high shool.

The Williamses say that good farm practices, backed by sound credit arrangements are chiefly responsible for their success. In line with recommended soil conservation practices, they are gradually shifting from cotton to livestock. Acres that formerly were washing away under row-crop tillage are now seeded to grasses and clover as pasturage for their growing herd of cattle. CA is still helping them finance their production. This year, their loan totals $450.

African Teacher Studies Extension Work in Alabama

John Manly, teacher in a mission school of Sierra Leone, West Africa, is studying the Extension organization and porgram, as well as practical farming methods in Alabama.

Mr. Manley is on leave from his position to study and observe various aspects of agriculture in this country. Following special courses at Tuskegee, he has been spending some time with county agents, learning first hand the practical side of improved farming. This training has included a three-week tour of duties as a field hand for a colored farmer. On this farm, he learned to drive a tractor, operate a corn planter drawn by a mule, plow, drive a truck, and milk a cow.

He says that when he returns to West Africa, the training and practical experience he has gained here will help him raise the living standards of his people.

Mechanization to Play Important Part in Successful Farming in Future

The majority of successful farms in the future will be mechanized, says M. S. Williams, North Carolina Extension farm management specialist, who has made a study of mechanization in his state.

Although only about 4,000 of the state's 287,000 farms are now completely mechanized to the extent that they have no workstock, the trend, says Williams, is definitely toward mechanization. He points out that the number of tractors in the state increased from 12,756 in 1940 to 31,626 in 1945. And as more tractors and other equipment become available, North Carolina farmers are expected to take advantage of the opportunity to mechanize, says Williams.

SWEET SIXTEENERS

High school girls (and boys, too!) learn how to make many kinds of products for sale at Junior Achievement—and come out with a profit. This group of girls is learning how easy it is to make all sorts of delicious candies and cookies.

Here you see their group leader, a trained Home Economist, demonstrating to the girls some interesting cookery short-cuts—such as using a special candy-making chocolate for quickly made, professional-looking candies. Chocolate Coconut Patties, one of the easiest of these, are made as follows:

Simply take a parcage of Dot Chocolate and heat over boiling water until partly melted, then remove from boiling water and stir rapidly until entirely melted. Add 1 3-4 cups shredded cocoanut and stir until blended. Drop from teaspoon on waxed paper. Cool until firm. Makes 2 dozen.

And for Chocolate Chip cookies shown above, here's the easy-to-follow recipe:

1-3 to 1-2 cup shortening; 1-2 cup granulated sugar; 1-4 cup brown sugar, firmly packed; 1 egg, well beaten; 1 cup sifted flour; 1-2 teaspoon salt; 1-2 teaspoon soda; 1 package semi-sweet chocolate chips; 1-2 cup chopped nut meats; 1 teaspoon vanilla. Cream shortening; add sugars gradually and cream together until light and fluffy. Add egg and mix thoroughly. Sift flour once, measure, add salt and soda, and sift again. Add flour in two parts and mix well. Add chocolate chips, nuts and vanilla and mix thoroghly. Drop from teaspoon on ungreased baking sheet about 2 inches apart. Bake in moderate oven (375 degrees F.) 10 to 12 minutes. Makes about 50 delicious tasty cookies.

NAACP Urges President Press Rights Program

New York, Nov. 4—Calling President Truman's victory in last Tuesday's national elections a "mandate" for a program of progressive legislation on the issues "cavalierly rejected by the 80th Congress," the National Association for the Advancement of Colored People congratulated the President on his re-election and renewed its plea for full administrative and legislative support for a federal civil rights program.

In a telegram extending to Mr. Truman the Association's wishes for a successful administration, Walter White, NAACP secretary, stated: "The National Association for the Advancement of Colored People congratulates you upon your well-deserved victory and wishes for you a most successful administration. Your triumph, achieved over both the extreme right and extreme left, is a mandate under which you and the new Congress can proceed to carry out the program you outlined so clearly and courageously to the people, including housing, labor legislation, civil liberties and inflation, all of which were cavalierly rejected by the 80th Congress. We especially urge you to continue to maintain your forthright position by giving your full and complete support to your legislative and administrative program for civil rights."

54 North Carolina Colored Farmers Produce 100 Bushels of Corn Per Acre

As a means of paving the way for increased livestock production and a more balanced farming program in the South, many white and colored farmers in that region are carrying out intensive efforts to increase their production of corn and other feed crops, report the State Extension Services.

While the average corn yield in the South in only about 15 bushels per acre, as compased with 30 for the United States as a whole and 47 for Illinois and Iowa, some farmers in the Southern States are shooting for 100 bushels per acre yields.

For example, 619 farmers in North Carolina have produced corn yields of 100 bushels or more per acre. Of this number, 54 are colored, says R. E. Jones, State Extension agent for colored farmers. Producer of the highest yield among the colored farmers is William M. Chance, who got 131.1 bushels per acre last year. Three other farmers in the state got yields ranging from 115.9 to 123.7 bushels per acre. One woman farmer, Mrs. Thelma Sanders, got a yield of 105.6 bushels per acre.

Most of the 100-bushel per acre farmers used a hybird variety of corn. And they planted their corn following a cover crop which had been turned under. Also, some used top side-dressing and other methods of fertilizing their soil. The average cost of their fertilizer was only 20 cents per bushel of corn produced, as compared with an average price of about $2.25 per bushel which they received for their corn.

As a result of their excellent start in increasing their corn production, several colored farmers in North Carolina have come together and formed a 100-Bushel Corn Club. The organization is headed by Alpheus Gatlin of Murfreesboro. He produced a corn yield of 105.4 bushels per acre in 1946.

NAACP Lauds St. Louis Branch For Defeat Of Slum Clearance Bond Issue

New York, Nov. 4 — Expressing gratification over the defeat in last Tuesday's election of a $16,000,000 bond issue for a proposed St. Louis slum clearance project which failed to guarantee adequate housing accommodations on a non-discriminatory basis for persons to be displaced, the National Association for the Advancement of Colored People congratulated its St. Louis branch for its "hard-fought victory" in achieving defeat of the proposal.

The NAACP held that housing conditions of Negroes in St. Louis would have been made infinitely worse had this measure been approved. The success of the St. Louis branch in helping to bring about its defeat is regarded by the NAACP as an advance in its fight against "the discriminatory practices of housing authorities, urban re-development companies, real estate boards, building and loan, and other lending institutions."

Youth Action in World Affairs Is Keynote Of NAACP Conference

St. Louis, Mo., Nov. 8—"Youth on the Team, Not on the Sidelines," will be the theme of the tenth annual youth conference of the National Association for the Advancement of Colored People, which meets here this week, Nov. 10-13.

Carrying out this theme in his keynote address, Lawrence C. Howard, Vice President of the Des Moines, Ia., NAACP Youth Council, will urge young people to play an active part in current affairs and to plan for the solution of problems affecting minority groups in the United States. The twenty-three year old Mr. Howard is an active student government officer at Drake University in Des Moines, a member of the student-faculty council, and associate editor of the Drake University newspaper, THE SYMBOL.

More than 250 representatives of NAACP youth councils and college chapters and of other college inter-racial and inter-faith groups are expected to attend the four-day series of committee and mass meetings, which will be held at the St. Louis Central Baptist church.

Building A Greater Metoka Work

Alameda, Calif. — (Special) — There will be an enlargement of the Metoka classes out here in the state of California, according to an announcement made recently by Mr. Harris Alvin, Jr., who is the group superintendent of the Metoka Department of the Mt. Zion Baptist Church. He has communicated with the secretary of the National Baptist Publishing Board, asking for a full supply of these publications and regular shipments each week of the National Baptist Union-Review. He feels that if the information can reach California on the importance of this organized class, the church people themselves will support it more ardently, thus, he has set about, along with his co-workers, to have a larger enrollment for the Metoka work, and he hopes by this that the Galedas will follow suit and increase their membership.

Mr. Alvin is also certain that the use of the Metoka Arm Bands, the Metoka Pennants, the Metoka and Galeda Class Pins, the installing of the regular Metoka Hand Book in each class, along with the Metoka and Galeda Song, even the Metoka and Galeda Yell, will put a kind of college spirit and enthusiasm in the hearts of each of these members, so that they will get joy out of coming to the Sunday school, working in these classes and supporting the church program.

As A Man Prays

Psalms 7:5. Read vs. 1-9, or the whole Psalms

AT AGE 5—"Now I lay me down to sleep, I pray the Lord my soul to keep—and God bless mama and daddy. Amen."

At age 10—"Our Father who art in heaven, hallowed be thy name—Please, God, help me lick Jim Martin."

At age 15—"God help me make the basketball team, and do make Eloise come to the game and watch me play."

At age 25—Not praying.

At age 30—"God help me carry on when we go over the top tomorow. Don't let me be afraid to die if my number is up, but do let me live to see Eloise and little Mary again."

At age 35—"Dear Father, help me to make a success of this new undertaking. Let me make good for the sake of Eloise and the children."

At age 40—"O God, spare my little son. Spare his life, I beseech thee. Nevertheless, thy will be done."

At age 50—"O God, spare my little son. Spare his life, I beseech thee. Nevertheless, thy will be done."

At age 60—"O God, help our Mary to bear the trial that has come to her. Help her not to become bitter and hard, but to grow fine and understanding."

At age 60—"Comfort the children fo rthe loss of their dear mother. Comfort all those who mourn, and make them believe in thee and thy world of light and happiness beyond, where dear Eloise has gone."

At age 70—"O God, I thank thee that my time is coming when I am going to join Eloise. Don't let the children mourn for me. Comfort them, and do bless them and keep them in thy loving care."

Educational Institutions Whose Programs Are Geared To Give Instructions to Old and Young

Land Grant Colleges and Associate Land Grant Colleges, with the States and Towns In Which They Are Located, Correct Names and Addresses of Their Presidents to Whom Readers of the Modern Farmer May Write

Twenty-four schools whose curriculum has been accepted by State Boards of Education, in which the youth can major in subjects that he likes best, and where he can pursue such study courses which when he has finished will help him in his life's work. These institutions challenge the admiration of the educated people of today. They are Land Grant Colleges and Associate Land Grant Colleges. While they do specialize in agriculture, home economics, dairying, farming, cattle raising, poultry raising, truck gardening and other pursuits of industry and agriculture, they are doing this because there is need for them. There is no race, no creed or color in vegetables, poultry, butter, eggs, beef, pork, beans, potatoes; in fact, what the world subsists upon, nobody asks—who raised it? So therein, lies the solving of much of our high cost of living.

The Modern Farmer therefore, invites the readers to write a letter to each or all of these colleges and ask them to send you their Catalogue so that you can read, study and make your own decision from the following schools:—

LAND GRANT COLLEGES AND PRESIDENTS

Alabama (Normal) A & M Institute; President J. F. Drake
Arkansas (Pine Bluff) State College; President L. A. Davis
Delaware (Dover) State College; President H. D. Gregg
Florida (Tallahassee) A & M College; President W. H. Gray, Junior
Georgia (Savannah) State College; President James A. Colston
Kentucky (Frankfort) State College; President R. B. Atwood
Louisiana (Scotlandville) Southern University; President F. C. Clark
Maryland (Princess Anne) Princess Anne College; President J. T. Williams
Mississippi (Alcorn) A & M College; President W. H. Pipes
Missouri (Jefferson City) Lincoln University; President S. D. Scruggs
North Carolina (Greensboro) A & T State College; President F. D. Bluford
Oklahoma (Langston) Langston University; President G. L. Harrison
South Carolina (Orangeburg) State College; President M. F. Whittaker
Tennessee (Nashville) A & I State College; President W. S. Davis
Texas (Prairie View) Prairie View State University; President E. D. Evans
Virginia (Petersburg) State College; President L. H. Foster
West Virginia (Institute) State College; President J. W. Davis

ASSOCIATE LAND GRANT COLLEGES AND PRESIDENTS

Alabama (Tuskegee) Tuskegee Institute; President F. D. Patterson
Atlanta (Atlanta) University; President R. E. Clement
D. C. (Washington) Howard University; President M. W. Johnson
Georgia (Fort Valley) State College; President C. V. Troup
New Jersey (Bordentown) Manual Training School; President W. R. Vallentine
Ohio (Wilberforce) Wilberforce University; President C. W. Wesley
Virginia (Hampton) Hampton Institute; Dean S. J. Wright (no President at the present time)

Coal Keeps Its Place

The president of the National Coal Association has pointed out that "it is amazing how many Americans — and intelligent ones, too—still picture coal mining as a pick-and-shovel business using underground mules and paying low wages.'

Those Americans have overlooked the remarkable changes that have taken place in the coal industry in recent years. The most significant of those changes has been the emphasis on mechanization—on methods which permit each miner to greatly increase his output, which have eliminated much of the old drudgery, which produce a higher and more uniform quality of coal, and which, finally, have sharply cut the accident rate. Mechanization is progressing at an enormous dollar cost to coal operators.

The once low-paid miner has been the greatest beneficiary of mining progress. Many miners earn upwards of $100 a week, and the average is around $77. The miners, as a group, are the highest paid of any comparable labor force in the country. They have a liberal pension plan, and many other valuable benefits.

From the technological point of view, coal has made similar progress. It is one of the vital factors in the new and exciting field of synthetics. It is experimenting with ways to use coal efficiently in powdered and other forms. It maintains active organizations to deal with the problems associated with the use of coal in industry and the home. It is vitally concerned with bettering its product, selling it at a reasonable price, and making it more attractive to users.

Coal, to sum up, has kept its place in the march of industrial progress.

How to Keep a Market

"Markets you are supplying with products now are the ones that will stay with you during the flush and more productive of the years," says A. W. Jones, extension marketing specialist.

He explains that a steady buyer likes a steady source of supply and is willing to pay an added premlum for such service in one way or another.

Farmers gind they keep a market when they provide customers with a steady flow of high quality eggs, poultry, beef, pork, sweetpotatoes, leafy vegetables, peas, fruits, and other products.

To develop a year-round market, Jones suggests that you find a good outlet, stay with it and see if it won't make money for you as it does for other successful market growers.

The Copper Skin Sweetpotato

The copper skin Porto Rico sweet potato has a tendency to run out or lose color and type.

"To maintain a desirable strain," says John Bagby, extension marketing specialist, "select sweetpotatoes from the best hills and use them as foundation seed stock."

He says that this may be done at digging time. Follow the plow and select hills with at least four U. S. No 1 sweetpotatoes in them. Potatoes should be fairly uniform in shape, free from disease and show the characteristic copper skin color. Any potatoes showing white streaks or purplish color should be thrown aside.

"Before bedding the selected sweetpotatoes in the spring, nick them with a knife and keep only those that show a good salmon-pink color," advises Bagby.

Alfalfa

For farmers who plan seeding alfalfa this information should be of value. Complete fallowing land for alfalfa. Disk in the fertilizer and have land ready to seed. If you live in north Alabama August 15 to September 1 is the date to plant. For central Alabama September 15 to October 15. Make a note of this because planting too early or too late may cause you to fail.

Fire Marks

When fire insurance companies were first organized in this country, and for a considerable period afterwards, policyholders were issued Fire Marks — metal devices which were attached to the properties covered, much as street numbers are today. They served two primary purposes — first, to discourage malicious arson by showing that the owner would not greatly suffer if the building were destroyed; second, to guarantee to the holy competitive fire brigades of the time that the outfit which extinguished a blaze on the premises would receive a handsome reward from the company. As a consequence, the fire alarm bell was the signal for a pell-mell race to the scene by all the brigades in the vicinity.

Times have changed, and Fire Marks are now collectors items. Practically all property of any value is insured. Fire departments are municipal functions, and we arent expected to reward the firemen for their services as they draw regular salaries. But the menace of fire, always serious, is infinitely greater than in the long-gone era when the fire insurance companies were formed to provide an essential protection.

We are the most careless and wasteful people in the world when it comes to fire. Because of our negligence, fire takes 10,000 lives a year. It destroys $700,000,000 worth of property. It accounts for an indirect loss which runs into the billions. It consumes irreplaceable natural resources.

The Fire Mark of yesterday adorned the property of foresighted citizens. The foresighted citizen of today has his insurance policy in his safe—but, at the same time, he should be taking an active part in the war against fire.

Stored on the Hoof

Dr. Karl F. Butler, president of the American Institute of Cooperation, recently touched on a vitally important yet little recognized phase of the meat animal industry.

"Nations with large livestock herds," he said, "have an automatic cushion between the people and the harvests. They simply represent stored food on the hoof." In other words, the grain, grass and other fodder the animals consume is turned into meat. It is ready to be used when needed. And, on top of that, the natural fertilization of the land which resuluts from the raising of livestock is a vitally important element in maintaining and increasing the humus content of our soils.

Countries which depend entirely on their harvests to support the people are periodically plagued with famines. China and India are prime examples of this. These countries have no animal industry of consequence. They must live on their rice and their grain in the form in which it is produced. A series of poor crops may result in the death by starvation of hundreds of thousands of people. In the United States, where we can rely on livestock as a dietary cushion in years of subnormal harvests, the food supply is always adequate.

Furthermore, a very substantial percentage of all livestock is raised on grass, forage and other foods which are not suited for human consumption. But, when converted into meat, they provide much of the nation's sustenance.

This country is fortunate in its progressive, growing livestock industry—and in the thousands of packing plants which compete for the meat supply, and send it through the channels which bring it finally to the dinner table in the most edible form.

Sweetpotato Storage

Those who use old-fashioned potato banks to store their sweetpotatoes should be careful to build them with plenty of ventilation. Make four short troughs by nailing together pieces of 1x6 and bore holes in these. Turn them upside down end runs to the center. Make a and arrange so one end is outside the bottom of the bed and the other stack with 1x6's up through the middle.

Conserving Family Purchasing Power

Jay D. Runkle, Chairman of the Board of the National Retail Dry Goods Association, recently spoke of "three important areas in which manufacturers and retailers must work together to attain the efficiency and harmony needed in this next period of our economic life."

First, he said, there should be an even better understanding of consumer wants — along with ways and means of increasing and expanding those wants.

Second, products must be produced and distributed as economically as possible.

Third, we must work together to acquaint consumers with the merits of those goods and stimulate their interest in buying them.

This, in brief form, sums up the basic ideas which underlie the American system of mass production and mass distribution of commodities of all kinds. American retailers and manufacturers, for example, usually work on a lower margin of profit than do their counterparts in any other country. That is possible because enormous volume results in adequate total earnings even though the profit on each individual sale is so small as to barely affect the selling price to the consumer. And that is one of the big reasons for the high purchasing power of the typical American family.

Elsewhere in his talk Mr. Rungreat by producing more for less cost." That is still the goal of every intelligent producer and seller of goods. And that is why retailing, paced by the chain stores, along with other major elements in economy, is fighting aggressively against unbridled inflation.

88 Rural Youths Gathered in Louisiana for First Southwide 4-H Encampment

Washington, D. C. — The first Southwide 4-H Club Camp for rural colored boys and girls opened Tuesday, August 24, at Southern University, Baton Rouge, Louisiana.

The encampment continued through August 30. Eighty-eight delegates from 16 States were in attendance, representing the Nation's 300,000 colored 4-H Club members. The delegates were accompanied by 29 extension leaders.

Program of the camp consisted of a series of addresses by white and colored leaders, group discussions by the 4-H'ers, sightseeing tours of New Orleans, Baton Rouge, the Louisiana agricultural experiment station, and an oil refinery near the capital city. Other recreational activities included a boat ride on the Mississippi river, and calisthenics and games on the campus at Southern.

T. M. Campbell and John W. Mitchell, Extension Service Field Agents, were in charge of the encampment which was sponsored jointly by Federal and State Extension Service.

Principal encampment speaker was Dr. Marshall L. Shepard, recorder of deeds for the District of Columbia. In line with the camp theme—"Creating better homes today for a more responsible citizenship tomorrow" — Dr. Shepherd spoke on "leadership and citizenship."

Other encampment speakers were Dr. F G. Clark, president of Southern; H. C. Sanders, director of the Louisiana State Extension Service; Miss Patsy Graves of the Farmers Home Administration; and Dr. Roscoe C. Brown of the U. S. Public Health Service.

States represented at the encampment are: Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, Missouri, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

Wise farmers will begin to get wnter legume seed early to plant this fall. This is a job to do in the month of June.

Negro Farmers Substituting Pork Production for Tobacco . . .

In line with the Nation's demand for increased production of meats, many colored farmers in tobacco areas are shifting to hog raising as a practical means of making up the potential income loss which may result from the reduction in tobacco acreage quotas, reports John W. Mitchell, Extension Service Field Agent.

Mitchell says that scores of colored farmers in North Carolina and Tennessee are purchasing grade and purebred gilts to farrow this fall. He points out that this is in keeping with the Department of Agfiriculture's request that farmers increase their hog production by at least 10 per cent to provide a minimum of 34,400,000 pigs for marketing in the spring and summer of next year.

Conduct Farm Demonstration to Show Extent Tractor May Replace Mule

To encourage mechanized efficiency by showing farmers the extent to which the latest mechanical equipment may replace mule power in the production of cotton and corn, the agricultural engineering department of North Carolina State college is conducting a tractor power demonstration in nine counties of the State.

Using a five-acre demonstration field in each of the selected counties, the engineers will utilize tractors and other farm machinery in planting and cultivating cotton and corn crops. Farmers in the South are now operating nearly 400,000 tractors, but only a small percentage o fthem are being used for planting and cultivating row crops, say Department of Agriculture officials.

Say Dividends from Farming Should Include Family Well-Being

It's not enough to measure successful farming in terms of cash income, the real dividends should include the well-being of every member of the family, said a panel discussion group at the recent Extension Service Conference on Family Life.

The panel discussion, which highlighted the six-day conference, was held in the Jefferson Auditorium of the U. S. Department of Agriculture. Participants included Dr. Ernest Osborne of Columbia University, Mrs. Lydia Ann Lynde of Extension Service, and Dr. Carl Taylor of the Bureau of Agricultural Economics.

The discussants said that farm planning should take into account the thealth, happiness, and general well-being of every member of the family, and the aims of the farm plan should represent the integrated, personal goals of each member. As an example of inadequate planning, one member of the panel related how a family set paying off a mortgage as its main objective, and then decided to sell one of their milk cows in order to apply more money to the debt, even though it meant less milk for their growing children.

It was pointed out also that a farm family cannot shift from one type of cropping system to another without taking into account how it may affect Johnny's school work, or mom's home chores. The real dividends from farming, the panel concluded, must be measured not only in terms of cash income, but also in terms of the entire family's opportunity for happiness and general well-being.

Permanent Pasture

Continue fallowing land to be seeded to permanent pasture mixes in September. Clean up lowland areas, plow and disk so they can be put into pasture. Apply lime where needed. Fertilize well.

Value of 1947 Cotton Crop Second Highest on Record

The 1947 cotton crop of 111,851,000 bales together with the cottonseed was valued at $2,291,202,000, the second highest on record, reports the Bureau of Agricultural Economics of the U. S. Department of Agriculture.

Last year's cotton production was 3,200,000 bales larger than the 1946 crop, but about a half million bales smaller than the 1936-45 average. The 21,500,000 acres of cotton in cultuivation on July 1 last year was 18 per cent larger than the 1946 acreage. Lint yield, indicated at 267.2 pounds per harvested acre, was 31.9 pounds above the 1946 yield.

To Construct Library Building in Memory of W. Va. Home Agent

Plans are underway for the construction of a library building on the campus of West Virginia State college in memory of the late Mrs. Altha C. Allen, first colored Home Demonstration At-Large in West Virginia, reports L. A. Toney, State Leader of Extension Service.

The construction of the memorial library is to be a cooperative enterprise in which will participate several civic, religious, and fraternal groups, and the Extension Service of West Virginia State college.

Mrs. Allen, who served in Extension Service from 1936 to '41, was a pioneer in the field of agricultural extension work among rural colored people of the State. She laid the foundation for home demonstration and developed several State-wide events for colored farm people, including a fair and a 4-H Club Rally Day. Also, she designed a clothes hamper which is widely used throughout the State.

Farm Employment Increases Slightly in South, But Shows Long-Time Decline

With cotton planting and chopping underway in the South, farm employment of hired and family workers showed a slight increase in that region on May 1, compared with the same period a year ago, but the long-time trend indicated a continued decline, reports the Bureau of Agricultural Economics of the U. S. Department of Agriculture.

On May 1, there were 5,484,000 hired and family workers employed on farms in the South, as compared with 6,338,000 on the same date during the period 1935-39, a decline of 854,000. For the rest of the country, the decline in farm employment totaled only 243,000.

The long-time decline reflects migration from the over-crowded area, expansion in the size of farms, and increased use of mechanized equipment. Colored farm people in the South make up nearly one-fourth of all farm operators in that region and about half the hired farm workers.

Extension Service Director on Brief Mission to Greece

M. L. Wilson, Director of Extension Work of the U. S. Department of Agriculture, has left for Europe on a brief assignment as technical consultant and adviser to the American Mission for Aid to Greece and the Greek government.

He will help the Greek government strengthen its extension system in order to increase the effectiveness of the agricultural phase of the aid program. Director Wilson's services were specifically requested and temporary leave has been granted by the Department. The assignment is expected to take from two to three months.

Good News

Some encouraging news for oil users has come from the Oil Industry Information Committee. The heavy gasoline consuming season has drawn to a close, and the ail companies are now engaged in meeting a winter demand for fuel oils which is expected to reach record proportions. The Committee says: "Oil companies everywhere have broken all production records . . . and, barring unforeseen circumstances, will continue to do so this winter."

The figures concerning oil use are enough to make the head swim. Domestic fuel demands are more than double the prewar level, and 20 per cent over last year. This means that these oils are being consumed at the rate of 41,000,000 gallons every day of the year. And our consumption of all petroleum products averages close to 250,000,000 gallons daily.

Record demand is not confined to gasoline and to oils for heating systems. The domestic demand for kerosene, for instance, has increased by almost 70 per cent since 1941, due largely to the wider use of space heaters of various kinds.

One cheering development has been improvement in the transportation situation — including tank cars, pipelines, and barges. It isn't as good as it will be in the future, but the transportation problem is expected to be less acute than last winter.

All in all, it looks as if oil demand and oil supply are coming into balance. If consumers will use reasonable conservation methods, they will save themselves money—and they will help to prevent shortages and dislocations.

Coal Mining As a Career

Coal mining, as a career, offers far greater attractions to young men than ever before.

It is reported that an increasing number of universities are offering courses in coal engineering. In many instances these are supplemented by scholarships. And the industry has fine employment opportunities for men who are prepared for responsible positions.

This situation is not limited to those who are able to carry their educations to the point of obtaining professional degrees. The coal miner himself is an exceptionally well paid member of this nation's working army. His average wage is the highest in mass industry, and earnings in excess of $100 a week are not unusual.

On top of that, coal has come a long way from the pick and shovel era. More and more of the total production is accomplished with mechanical aids. Accident and fatality rates are far below old levels. And liberal financial safeguards have been set up for those who do become incapacitated because of injury, sickness ,and old age.

Job security in coal, as in any industry, depends upon demand for the product. There is no sign that the use of coal, despite the emergence of other fuels, will be anything but high in the foreseeable future. It constitutes the largest known supply of energy by an enormous margin. New discoveries are widening its usefulness and its efficiency as a source of heat and power. Its future is bright.

Those who choose careers in coal mining have the assurance that they are becoming part of a highly progressive industry, which produces an absolutely vital product.

Cotton

Get the most out of your cotton by having good grades. To get good grades, cotton must be mature and dry when picked. If cotton is dew-damp, dry in the sun before taking to gin. Cotton must be dry when ginned to get good grades. Keep cotton of one-variety together. Mixing varities of different staple langths cuts the makket value.

Xanthippus and His Dog . . .

Kindness indeed is of wider application than mere justice, for we naturally treat men alone according to justice and th elaws, while kindness and gratitude, as though from a plenteous spring, often extend even to irrational animals. It is right for man to feed horses which have been worn out in his service, and not merely to train dogs when they are young, but to take care of them when they are old. . . .

Many persons, too, have made friends and companions of dogs, as did Xanthippus in old times whose dog swam all the way to Salamis beside his master's ship when the Athenians left their city, and which he buried on the promontory which to this day is called the Dog's Tomb. We ought not to treat living things as we do our clothes and our shoes, and throw them away after we have worn them out; but we ought to accustom ourselves to show kindness in these cases, if only in order to teach ourselves the duty toward one another. For my own part, I would not even sell an ox that had laboured for me because he was old.—PLUTARCH, LIFE OF CATO V.

Early Planting of Cotton Pays

"The proof of the pudding is in the eating." The proof of early planting is in per acre yield. Napoleon Eggleston, Jr., gained by planting his cotton a few weeks earlier.

Eggleston lives just out of Tuscumbia in Colbert County. He plants 45 acres of cotton and some other row crops.

This was the first year Eggleston planted his cotton early states J. T. Bulls. April eighth and ninth were his planting dates.

Agent Bulls and three other farmers made boll count estimate. This was done August 18. They set his average yield at 2,000 pounds of seed cotton per acre. What Eggleston has picked since then proves that even this estimate was low.

Eggleston's yield was high, states Bulls, because: (1) He got ahead of carly weed growth. (2) He missed the heavy insect attack. (3) His cotton stood the late summer drouth better than cotton planted later.

Sideline Crops Provide Income for Electricity in Florida Homes . . .

Now that the Rural Electrification Administration has brought electricity within their reach, colored farm families in three more Florida communities have lights and other electric facilities, according to a report received by the U. S. Department from the Florida State Extension Service.

Many of the families financed the wiring of their homes from the sale of poultry and eggs and other sideline crops. Principal types of farming carried out in these communities, which are situated near Gainesville, are truck farming and dairying.

In addition to having electric lights, radios, refrigerators, and electric irons, some of the farm families in the area have installed electric pumps for watering their cattle.

Grow Rutabagas

A rop that furnishes a lot of good eating at low cost is the rutabaga. A good piece of branch head land is a good place to plant rutabagas. It requires 75 to 90 days for rutabagas to mature, so they must be planted before fall turnips. August 15-30 is a good date. The American Purple Top variety, planted on well fertilized land, is best. They may be stored in a very similar manner to sweetpotatoes for winter use. Try trimming some and dipping in hot paraffin wax for market purpose.

The Sound Way

Wesley Hardenbergh, president of the American Meat Institute, recently made some down-to-earth remarks on the much discussed and much misunderstood meat question.

"The present highly competitive situation which exists in the meat business," he said, "is the only sound way . . . of matching up the supplies of meat with buying power and doing so in a way that costs the consumer a minimum amount.

"It is true that under this system some people at times may not be able to buy as much meat as they want or buy any at all, but this percentage is very much smaller today than ever before and more people are eating more meat today than they were prior to the war.

"Government figures on consumption per capita bear this out. Obviously, this situation is much to be preferred to a situation such as we had under controls following the close of the war when many people weren't able to obtain meat at all, and others had to pay excessive black market prices for it.

"Experience has demonstrated beyond doubt that the only result of efforts to regulate meat prices in peacetime would be to create a black market bonanza."

The substantial fluctuations which have been taking place in wholesale meat prices are in themselves evidence of how well the supply and demand system works, and how sensitive it is to changes in conditions. Under it, all prices always find their proper level. A regimented economy, on the other hand, such as that which price control would create, inevitably produces scarcity for the masses of people— along with outrageous black market prices for the few who can afford to pay them.

Never lose a chance of saying a kind word. As Collingwood never saw a vacant place in his estate but he took an acorn out of his pocket and planted it, so deal with your compliments through life. An acorn costs nothing, but it may spread into a prodigious timber.—WILLIAM MAKEPEACE THACKERAY.

Extension Milk Cow Purchase Program Proves Profitable to Negro Farmers

Besides having an adequate supply of milk for their growing children, the 49 Person County, N. C., colored farmers, whom the State Extension Service helped to buy a carload of heifers five years ago, have made a gross profit of $3,000 from the sale of calves and they still have their original stock, says State Leader R. E. Jones.

An Extension agent helped the farmers make credit arrangements with a loan bank for the purchase. The 61 grade Jerseys cost a total of $2,749.50. Forty-five of the animals have produced 95 calves—40 males and 55 females. All of the male calves and 22 of the females have been sold. They brought a total of $2,933. The animals still on hand are valued at $7,135.

Forty-three of the farmers are receiving good service from their cows and consider the purchase an excellent investment. The cows average 3 1-2 gallons of milk per day.

Through C R O P American Farmers Are Feeding the Hungry and Building a Better World

Chicago. Ill.—Thanksgiving will take on new meaning this year—both for American farm folks and for thousands of hungry persons overseas.

Between Thanksgiving and December 10, a minimum of eleven states will assemble state food trains for overesas relief.

Although the largest movement of food trains will occur during this two week period, this will represnt one of the high points, rather than the beginning, of the largest voluntary overseas relief effort ever supported by America's rural people.

By year's end it is estimated that American farmers will have contributed between 2500 and 3000 carloads of food, including whole grains, beans, nuts, dried fruit, canned meat, raw wool and cotton.

By January 1, between 25 and 30 states will have sponsored trains. Over 100,000 volunteer canvassers will have visited their neighbors, soliciting gifts in kind for the needy overseas.

Back in July the Badger milk train rolled from Wisconsin. From Ohio and Kansas, in August, came trains of wheat. Oklahoma and Texas each contributed a section of care to the Will Rogers Memorial Goodwill train in September. Colorado also assembled a short train.

Other state trains—in the Midwest, Far West, and South—are scheduled to be assembled around Thanksgiving. Ohio, Kansas and Colorado have made plans to assemble second trains.

Everywhere farm folks are supporting this effort to feed the hungry and create goodwill around the world.

Fifteen families, all members of a small Lutheran church near Weskan, Kansas, gave a 1500-bushel car of wheat. This challenge, broadcast over Kansas with the slogan, "If Weskan We Can," produced contributions from every county in the state.

In Henry County, Ohio, farm folks contributed five carloads of wheat.

A Methodist minitser in Montana on a salary of $100 a month made a cash contribution of $50.

John Crom of Aurora, Nebraska, accepted the job of county chairman, because he had a debt to pay. "I know what it is to be on the verge of starving," he said. "During the war a Russian girl and a Chinese doctor found me and nursed me back to life. I made a vow then that, if ever the chance came to me to help someone else in need, I'd do my full share." Under his leadership Hamilton county gave three carloads of wheat.

In Red Willow County, Nebraska, where twelve people were killed by floods last spring, farmers gave 1,445 bushels of wheat and $356 in cash. "Others helped us when we were in need. Now it's our turn to help," a spokesman said.

Thousands of children in Iowa brought enough money to school to purchase a quart of milk for some child overseas.

The idea of sending gifts in kind from American farmers to hungering neighbors overesas was born in the minds of half a dozen men in August, 1947. Among these was John D. Metzler, who was then in charge of material aid for the Brethren Service committee at the relief depot at New Windsor, Maryland. Metzler is now national chairman of CROP, with headquarters in Chicago.

The idea was presented to Church World Service, the official relief distributing agency of twenty-one Protestant churches, and to Lutheran World Relief, the official agency of that church. These two groups decided to sponsor such a program and the name, Christian Rural Overseas Program was chosen. Today the program is known from coast to coast as CROP

On June 1, 1948, Catholic Rural Life became a co-sponsor of the program, making it one of the largundertaken.

Today CROP is administered by an executive cabinet on which the three sponsoring agencies are represented. Metzler, representing Church World Service, is chairman. Catholic Rural Life is represented by Father H. J. Miller, and Lutheran World Relief by Rev. C. F. Schaffnit. In each state in which CROP operates, an advisory committee has been set up. On this, all major farm groups are represented.

Of the early days of CROP, Metzler recently said: "It was agreed that rural folks had not had the same opportunity as city people to contribute ti overseas relief. It was believed that, if the need were made known, farmer would be glad to give from their orchards, fields, and livestock pens. Those unable to contribute gifts in kind could give cash, which would be used to purchase exportable commodities.

"We decided that since self-help is the basis for long-range rehabilitation, we would send unprocessed farm commodities whenever economical. We wanted especially whole grain, beans, nuts raw wool and cotton. All these would provide employment as well as relief.

"To keep expenses as low as possible in this country and to prevent small shipments from going astray or getting into the black market overseas, it was decided to handle contributions only in carload lots."

Although CROP did not originate the food train idea, much of the food on the original Friendship train came from communities in which CROP leaders were already at work.

The first big CROP train was the Abraham Lincoln Friendship train. Four sections of this train, one each originating at Sioux Falls, South Dakota; Lincoln, Nebraska; Council Bluffs, Iowa; and Springfield, Illinois, started to roll on Lincoln's birthday. These four trains picked up 283 cars of farm produce. Nebraska, alone, contributed 100 cars.

From this early experience with trains, it was decided to launch state trains at times which were the most advantageous for getting a good share of the crop.

The most effective method of organizing a state has been to appoint a full-time state director. This person sets up an advisory council, usually consisting of the heads or executive secretaries of the Farm Bureau, Grange, livestock and elevator associations, and state agricultural extension service.

The state director divides the state into 12 to 20 districts and appoints chairmen over each. These district chairmen in turn appoint county chairmen who set up organizations down through the various townships. Volunteer canvassers contact individual farmers.

State campaigns usually cover a period of from three to four weeks. Often a special chairman is chosen to head such campaigns.

As of October 1, state organizations had been set up in the following states: Alabama, California, Coloroda, Georgia, Idaho, Indiana, Iowa, Kansas, Michigan, Minnesota, Montana, Nebraska, Nevada, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, South Dakota, Texas, Washington, Wisconsin, Wyoming.

Other states, esecially in the South, were on the list to be organized.

All food is distributed overseas through church channels— solely on the basis of need, regardless of religious or political affiliation, or color. CROP's sponsoring agencies have made distribution in 43 different countries, some in Asia.

One early shipment of CROP wheat went to Bremen, where it was processed in a huge mill which had been idle since the close of the war. Another shipment was distributed in the area near Linz, Austria where the storehouses of 50 old folks' homes were replenished.

A large share of the food reaches children, orphans, those in DP camps, and in hospitals.

Because of the bulk handling of shipments, losses have been held to the amazingly low figure of .004 per cent. Volunteer help, both on the part of church and farm groups, has kept administrative and promotion costs in the United States under 5 per cent.

As an example of genuine neighborliness, the giving of food by American farm folks through CROP has few equals.

Governor Val Peterson of Nebraska recently said: "A wonderful example of practical Christianity."

Representative Carl T. Curtis of the same state, speaking in Washington, said: "A dollar spent by a church group for foreign aid is equivalent to many, many dollars spent by the government. It is more effective; it is motivated solely by love for mankind and it carries a spiritual force that just does not exist in the dispensing of relief by governments."

Curtis also said: "There is no doubt that this relief sent abroad by the churches of America has been a good thing for the churches themselves. It has made them stronger; for 'faith apart from works is barren."

Spoken appreciation from Europe has come from such men as Dr. Eugene Gerstenmaier, head of the Hilfswerk of the Protestant churches in Germany, who said: "You have given the whole world an example of what charity in the spirit of Christ can do. You have helped us lay foundations for a better, more peaceful world."

Although eloquent words have not come from all who have benefitted from CROP, thousands who would have died without CROP's aid know what it means to have true neighbors in America.

Learn More That You Can Earn More, Mrs Thomasian Walker Tells A. & I. Students

Nashville—Becoming acquainted with all the available types of vocations is a basic step in seizing employment opportunities, Mrs. Thomasina Walker Johnson, of the U. S. Employment Service, told A. and I. students on Friday morning. Her address initiated Tennessee State College's 1948-49 W. S. Davis Lecture Series.

"I believe that Negroes continue to be trained and employed only in traditional occupations largely because they do not know about any others," she asserted. In order to broaden their knowledge of voational opportunities she referred the students to the Dictionary of Occupational Titles and to the Employment Servie Review which may be secured from the U. S. Employment Service.

Students would also do well to broaden their sights and seek employment opportunities outside their own locality," she continued. "Today there is a greater mobility of labor than ever before and many jobs are available in foreign countries. Several nations need skilled laborers worse than the U. S., she stated.

Mrs. Johnson explained that through counseling, testing, and guidance wiser selections of occupations can be made. "Everyone should be sure that they are fitted for the vocation for which they are training," she noted. "It would be better to change courses than to spend the balance of your life doing something for which you have no abiilty or aptitude."

Emphasizing that employment opportunities will be related to the type of world in which one lives, she urged active support for the FEPC and Civil Rights.

On Thursday evening she spoke on "Job Opportunities in a Contemporary World" in the Parlor of Alumni Hall, Tennessee State College. One of the two Negro lobbyists in the country, she is employed as minority groups consultant, U. S. Employment Service. She is a member of the Executive Board of Committee for a Permanent FEPC and is a legislative representative for the Alpha Kappa Alpha Sorority.

Paint perch poles with carbolineum or creewood oil to control mites.

Farmer Shifts to Dairying Now Averages $1,000 Monthly

By partly shifting their cropping program from tobacco to dairying, Mr. and Mrs. McKenzie Talley of Mecklenburg County, Va., have increased their farm income to more than $1,000 monthly, reports Ross W. Newsome, State Agent in charge of agricultural extension work among colored farm people.

Eight years ago, the Talleys were milking four scrub cows and separating the cream from the milk with spoon, says Mr. Newsome. At that time, their main reliance was in tobacco and small grain. But their soil was washing away. With the aid of the county agent and a Soil Conservation Service technician, Mr. and Mrs. Talley began shifting from row crops to pasture in order to reduce erosion.

Today, they have 45 head of grade and registered cattle. They are milking 30 head. Their average annual production is 6,000 pounds of milk per cow. However, they have one cow in the herd that has produced 17,000 pounds of milk during the last 11 months. Their gross income from dairying now is more than $1,000 a month.

The Talleys are no longer skimming the milk with a spoon, neither are they milking by hand. They have a modern, sanitary shed and mechanical equipment, including milking machines.

The Bible Way For Taking People Into The Church

Rev. G. A. Long, D. D., Secretary Evangelical Board, Has Issued A Little Pamphlet on this Subject

The National Baptist Union-Review has just received a copy of Dr. G. A. Long's pamphlet on "The Bible Way of Taking People Into The Church." He sent it as his contribution and matters for the column to be used by the Evangelical Board from week to week. The matter to be found in this tract says:

Jesus came into Galilee, preaching the Gospel: Repent Ye, and **Believe** The **Gospel.** Mark 1:15. Jesus did not preach: Physical. Natural nor Mental Science. He did not preach Geology. Jesus preached the Gospel of the Kingdom of God.

1. HOW JESUS TOOK PEOPLE INTO THE CHURCH

Now as Jesus walked by the sea of Galilee, He saw Simon and Andrew, his brother casting a net into the sea: for they were fishers. And Christ said unto them, come ye after me, and I will make you to become fishers of men. And straightway they forsook their nets and followed Jesus. Mark 1:16-18. Christ did not have any red tape in taking people into the Church. Christ did not have any mourners bench. Christ did not ask men to pray for Salvation. Christ did not ask men to feel before Salvation. Christ did not tell men to be sure of Salvation. Christ did not tell men to get religion. Christ told men to repent and believe the Gospel. Jesus taught the way for men to come to Him.

(A) THE WAY JESUS TOOK CHILDREN INTO THE CHURCH

Then were brought unto Jesus little children, that He should put His hands on them, and pray: and the disciples rebuked them. But Jesus said, Suffer little children, and forbid them not, to come unto me: for of such is the Kingdom of heaven. Matt. 19:13-14. Some **preachers** and **churches,** require children to be like grown people, but Jesus required grown people to be like children. Except ye be converted, and become as little children, ye shall not enter into the Kingdom of Heaven. Matt. 18:3. The preacher and the church should not demand more than Jesus. Jesus died for men, women and children, and knows what it takes to save them.

II HOW JESUS COMMANDED THE CHURCH TO TAKE PEOPLE INTO THE CHURCH

Jesus commanded the church and preacher to preach the Gospel. Jesus said unto them, Go into all the world and preach the Gospel to every creature, he that believeth and is baptized shall be saved; but he that believeth not shall be damned. Mark 16:15-16.

Jesus ordered the church to take people into the church upon their belief, their faith, in Him, their faith in the Gospel.

Without faith it is impossible to please God: for he that cometh to God must believe that He is, and that He is a rewarder of them that diligently seek Him. Hebrews 11:6. No one can be saved without faith in Christ Jesus. No one can be saved without faith in the Gospel of the Kingdom of God.

III. HOW THE DISCIPLES TOOK PEOPLE INTO THE CHURCH

Then Peter said unto them, Repent, and be baptized every one of you in the name of Jesus Christ for the remission of sins, and ye shall receive the gift of the Holy Ghost. Then they that gladly received his word were baptized: and the same day there were added unto them about three thousand souls. Acts 2:38-41-44. Peter did not have any red tape, he took every one into the church, who repented and believed on the name of Jesus Christ.

The jailer said to Paul, Sirs, what must I do to be saved? Paul answered, believe on the Lord Jesus Christ, and thou shalt be saved. And he took them the same hour of the night, and washed their stripes; and was baptized, he and all his straightway. Acts 16:30-31-34.

Philip and The Eunuch: Then Philip opened his mouth, and began at the same scripture and preached unto the Eunuch, JESUS. And as they went on their way, they came unto a certain water: and the Eunuch said, See here is water; what doth hinder me to be baptized? And Philip said, If thou believeet with all thine heart, thoc mayest. And he, answered and said, I believe that Jesus Christ is the Son of God. And he commanded the chariot to stand still: and they went down both into the water, both Philip and the eunuch; and he baptized him. Acts 8:36-37-38. Philip Baptized the Eunuch.

"THE BIBLE WAY FOR TAKING PEOPLE INTO THE CHURCH"

The Bible does not tell any one to come to the mourners' bench. The Bible does not tell any one to pray for salvation. The Bible does not tell any one to feel, in order to be saved. The Bible does not tell any one to get religion. The Bible does not tell any one to be sure of Salvation. The Bible tells all to repent and believe the Gospel. Matt. 28:19; Mark 16:15: John 3:16. The Bible tells the church and preacher to take people into the church upon their faith in the Gospel of the Kingdom of God. "Go ye into all the world and Preach the Gospel to every creature, he that believeth and is baptized shall be saved, he that believeth not shall be damned." **Faith, Saved Before The Cross of Christ. Faith, Saves since the Cross of Christ. Faith, will save to The End of Time.**

There are three ways to drown your sorrows—in the bottle, in tears and in increased activity. The last is the surest way to survive the deluge.

If there wasn't any fireside
When our daily toil is done,
No hope that there is heaven
When our earthly race is run,
We wouldn't want to tarry
On such a barren plane,
But pack what we could carry
And journey on again.

It is time to begin planning for winter grazing in 1948-49. Select your land and begin getting ready to plant crimson clover or crimson clover and rye grass for grazing. If you want late fall and winter grazing it is necessary to prepare the land well and seed early.

Approaching 45th Anniversary

Citizens Savings Bank & Trust Company Nearing Half Century Mark

On January 10, 1949 the stockholders of the Citizens Savings Bank And Trust Company will hold their annual meeting in this city at which time the bank will have reached its forty-fifth year of continuous operation. This official communication that will call the owners of the bank together will however, not be mailed out until the first week in December, 1948, which will give the out of town stockholders an opportunity to arrange to be present for this coming occasion, and to help observe this anniversary.

The president of the Citizens Savings Bank said the owners reside in twenty-two different states and two foreign countries; that while he does not expect a large attendance from out of the city, he does want them to have their official notice early enough so that they can designate some one to act as their proxy, because a stockholders' meeting cannot be held under the laws unless a majority of the stock is represented in person or by proxy.

The bank's quarters are being improved, renovations are being made as well as innovations instituted. This is the institution located in Nashville which was honored by having the late R. H. Boyd as its first president; J. C. Napier was the first cashier and Preston Taylor was the first chairman of the Executive Committee. While the bank does not operate with a national charter, as it is nont qualified to be a national pank, it is nationally known because the checks go out from this bank to every part of the country, down into Panama, the Canal Zone. the British West Indes, over into Canada, down into Mexico; in fact, the president of the institution has always declared that it is national in scope. Then too, it is the Depository of many well known, national organizations, such as the National Baptist Convention of America, the National Baptist Publishing Board, Departments of Fisk University, Departments of A. and I. State College, Departments and faculty members of Meharry Medical College, the Alpha Phi Alpha Fraternity, incorporated, the Denominational Trust Association and others too numerous to mention. It is used by the citizens in this the capital city of the state, coming from every walk in life. They are specializing in their Banking-By-Mail Department.

The stockholders, when they come together, will hear the reports of all the officers, the Executive Committee, the Board of Directors; they will then consider them, after which they will elect a Board of Directors to carry on the institution for the year 1949, and these directors in turn will select the officers and Executive Committee.

The stock has gone up, declared another member, until it is now worth $20.00 per share, according to those informed on book value of corporations, but the president said the bank has none of its stock for sale. All of this was disposed of on the 15th of July this year, so if any person wishes to buy stock they must find some stockholder and persuade them, if they can, to share their holdings with the new purchaser.

SAFETY

Avoid highway travel in wagons at night. If you are caught out carry a lantern. Be sure that light can be seen from front and rear. To the right is a sight too often seen on our highways. This man's mule was killed and he barely escaped with his life. He had no light.

109 Farm Labor Camps Sold; 104 to Continue in Use

The U. S. Department of Agriculture has announced that 109 of the 162 farm labor camps offered for sale last December have been sold. However, 104 of them will continue in use as housing for white and colored migrant agricultural workers.

Along with the camps went additional real estate and miscellaneous equipment used in housing workers under the recently concluded USDA Farm Labor program. Department officials say that 104 of the 110 temporary camps and five of the 52 permanent camps have been sold. Most of them will continue to serve migratory farm workers and will remain on the same sites.

The number of temporary camps sold in each of the Southern States is as follows: Delaware, 4; Florida, 10; Maryland, 5; North Carolina, 9; Tennessee, 1; and Virginia, 13. One permanent camp in Arkansas and three in Texas also were sold.

The equipment, buildings, and other facilities of the farm labor program were offered for sale last December. Authority to dispose of the camps continues until June 30, 1949.

Safety . .

Among kitchen utensils, knives are the biggest cause of accidents. A sharp knife is the safest kind to use. Dull blades most often cause accidents. A knife box or rack which can be mounted on the wall takes them out of the reach of children.

Potato Curing Houses and Equipment

Begin now to plan making over of farm buildings into sweetpotato curing houses for this fall. Make plans for repairing, cleaning, and disinfecting sweetpotato curing houses and storage crates. Check, repair, clean and service grading equipment before fall crops begin to move.

Decatur, Illinois Installs Pipe Organ

Antioch Baptist Church, Rev. P. W. Fields, Pastor, Will Dedicate Instrument, Henry A. Boyd, Guest Speaker

Decature, Ill:—Pastor, officers and members of the Antioch Baptist Church, located here at 600 Greenwood Ave., will dedicate their new pipe organ that was recently purchased and installed in the building. "It was the culmination of several years work on the part of the members and friends," declared the Rev. P. W. Fields, the pastor. He further stated that on December 12, 1948, at 2:45 p. m., there will be a regular dedicatory service and that the citizens of Decature, irrespective of denomination, had been extended an invitation to be present on this occasion. He also announced that the Rev. Henry A. Boyd, secretary of the National Baptist Publishing Board and secretary of the Sunday School Congress, had been invited as the guest speaker and that he had already accepted the invitation Dr. Fields declared that the Rev. Mr. Boyd would arrive in Decatur over the Wabash, train No. 11 at 2:12 in the afternoon of Sunday, Dec. 12, in time to play his part in this great occasion.

Gillin Describes South American Cultures At Atlanta University

Atlanta, Georgia, November 6—(Special)—In a series of three seminar discussions and one public forum this week at Atlanta University, Dr. John P. Gillin, professor of anthropology and research professor in the Institute for Research in Social Science, University of North Carolina, presented results of his researches and othnological expeditions.

Dr. Gillin was particlularly careful in expressing the emergent points of view of present-day anthropologists in the use of culture. He presented a newer and fresher look at peoples through their cultures, and offered a theory of learning and cultural conditioning fashioned out of the "Imitation and learning Theory" of Dollard and Miller of the Yale Institute of Human Relations.

First of the speakers in the 1948-1949 lecture series at Atlanta University, Dr. Gillin showed a need for ethnologizing the modern American community, particularly in the Southeast. "Anthropologists in the past", he said, "have spent perhaps too much of their energy looking at primitive and pre-literate societies. I think that the knowledge accrued in the field of anthropology should be applied to the contemporary community if social science is going to advance to the level of being able to predict behavior in human beings."

The Institute for Research in Social Science is at the present time undertaking ethnological investigations in southern communities of the Piedmont, plantation, timber and turpentine areas. Hylan Lewis, formerly on the faculties of Howard University and Hampton Institute, who is conducting one of the ethnological investigations in the Negro community of York, South Carolina, accompanied Dr. Gillin to Atlanta where conferences were held with the department of sociology at Atlanta University, in which an attempt is being made to coordinate the ethnological studies on St. Simons Island sponsored by Atlanta University with those of Dr. Gillin

At the forum meeting, Dr. Gillin presented an illustrative pictoral review of some of his researches in South America. The peoples and cultures of the Incas, the Mayas, and the Astec civilizations were explained in detail. Al though Dr. Gillin's researches are not conclusive, they do point to a need for a better understanding of peoples and their cultures especially in predicting and controlling behavior.

Radio Program Increases Interest in the Bible

There is no doubt that today there is a general increase in religious interest, as reflected by the increase in religious activity, reading of the Bible, and church attendance. Religious programs on the air have helped a great deal in bringing this about, and one of the most important programs in this respect is "The Greatest Story Ever Told," the dramatic presentation of the teachings of Christ which has been honored as one of the outstanding programs in the history of radio.

Dr. Frederick W. Cropp, secretary of the American Bible Society, pointed to this program as an outstanding example of what radio can do for religion. Dr. Cropp's society distributes millions of leaflets each year suggesting helpful Bible reading. In the society's work over many years, Dr. Cropp has noticed that today, more than ever before, the Bible is a "living book" which continues to be the "best seller" by all standards.

"The Greatest Story Ever Told," heard over the ABC network Sunday at 6:30 p. m., EST, is probably the first religious radio program which has dramatized the teachings of Christ in a way which makes these teachings reflect the prolems of our lives today.

It is the only program on the air which portrays the voice of Christ in actual passages from the Bible, and its high quality in presentation and strong influence on the listener has brought many of them to read the Bible more often and more carefully. Since this program is broadcast to fifty-eight countries throughout the world, in addition to our own land, its influence is really worldwide. The program is offered as a public service by the Goodyear Tire and Rubber Company, and contains no commercial announcements.

Rev. T. F. Freeman Honored

Pastor of Mt. Carmel Baptist Church Of Richmond, A Ph. D.

Richmond, Va., (Special)—One of the sons of the Old Dominion State has reached one of the higher pinacles in recognition from one of the leading universities of the United States. He is the Rev. Thomas F. Freeman, pastor of tre Mt. Carmel Missionary Baptist Church at 1303 North First Street in this city. The honor came to him from one of the leading universities, and the award was made early in the Spring of this year. The following statement concerning it was handed to a representative of the National Baptist Union-Review last week:

"In March, 1948 the Divinity School of the University of Chicago conferred upon Thomas F. Freeman the Ph. D., degree in the specialized field of preaching. According to a statement released by Dr. Charles W. Gilkey, Dean Emeritus of the Rockefeller Memorial Chapel at the University of Chicago, this was the first Ph. D. in the field of preaching granted by the University and is reputed to be the only Ph. D, in the field of preaching in the country. The title of Mr. Freeman's dissertation is: "A Study in the Criteria of Effective Preaching Through An Analysis of the Preaching of Phillips Brooks."

The Rev. M. Freeman is a native of Richmond, Va. He received his A. B. "Magna Cum Laude" from Virginia Union University in 1939. In 1942 he received the B. D. degree from Andover Newton Theological School, graduating as Valedictorian of his class. He served as minister of the Pleasant St. Baptist Church Westerly, R. L., and assistant Minister of the Monumental Baptist Church in Chicago. He served for two years as a member of the faculty of Virginia Union University and at present is the minister of the Mt. Carmel Baptist, a post which he has held since 1944

It is reported that he is among the few Ph. D.'s who occupy a Baptist pulpit in the country. It is a signal honor to the National Baptist Convention to have one of its young pastors carrying on in this cause."

No Substitute

Charles F. Kettering is one of the most famous engineers and inventors this country has produced. He has made a statement about the railroad industry which is worth repeating. "No matter what other forms of transportation do," he said, "or what new ones come into being, the railroads in their first century is only a promise of what they will do."

We all take railroad service for granted. The trains are always there, ready and able to do a job, when we need them. And back of that is a tremendous, dramatic story of the industry's growth and progress and improvement, often in the face of the most difficult obstacles. No other enterprise did so much to build the continent, to tie its far-flung regions together, and make for a unified nation.

Yet, good as their service is, the railroads are never satisfied. A short time ago, for instance, the Association of American Railroads completed arrangements to build a new railroad laboratary on the campus of the Illinois Institute of Technology at Chicago. Its purpose is to promote and speed the many-faceted work which will make the railroads of tomorrow far better than even the fine railroads of today.

The railroads have interconnected every section of a far-flung nation in a single century. Still, as Mr. Kettering said, that is only a promise of what is to be done in the future. The industry never stands still. It is always in transition—always looking for ways to better serve the great country which supports it.

Dr. J. E. Walker Heads Budget Committee

$50,000 Is The Goal Set By The National Negro Business League To Be Raised Next Year

Some of the high-power, successful business men who are on the executive committee and who are working with the National Negro Business League, elected Dr. J. E. Walker of Memphis, Tenn., to head the Budget Committee. They held their meeting here in Nashville last month and set the goal for $50.000.00. This amount is to be raised as a permanent operating fund of this organization which was founded by the late Booker T. Washington. Several Nashvillians who worked with Dr. Washington were life members. The late J. C. Napier, who was formerly the chairman of the executive committee, the late R. H. Boyd and the late Preston Taylor were a trio of these early Business League promoters.

Dr. Walker, who heads the Universal Life Insurance Company down in Memphis, and who is also president of the Tri-State Bank of Memphis, has sent letters out urging that those in a position to do so, will forward their checks at

Statement By Mr. J. F. Albright In One Of His Addresses Here

The Non-Discrimination Policy of the Veterans' Administration was fully explained here by Mr. J. F. Albright, which he says is enunciated by General Bradley as of December, 1945. Mr. Albright gives this as General Bradley's position:

"The Veterans' Administration is charged with the responsibility of rendering service to the veterans of our country's wars under the provisions of several pieces of national legislation. This legislation makes no distinction among the veterans because of race, creed, color or national origin. It will be the basic policy of the Veterans' Administration to work toward the elimination of any such distinctions that may exist in any program under its control.

General study of the entire Veterans Administration is being made. It is not possible at this time to state all of the changes which can or should be made, but you may be assured that when our investigation shows that there is any distinction being made in handling or treatment of veterans and their relatives, because of race, creed, color or national origin, in any matter under the control of the Veterans' Administration, that every possible step will be taken as rapidly as feasible to eliminate these distinctions."

President Of Meharry Commends Citizens Bank & Trust Co.

Dr. M. Don Clawson, in responding to an invitation extended to him, members of the faculty and students to support this institution, said:

"Nashville, Tenn., Nov. 10, 1948—Dr. Henry A. Boyd, President, Citizens Savings Bank and Trust Co., 345 Fourth Avenue, North, Nashville, Tenn., Dear Dr. Boyd: I want to thank you for your good letter of November 8.

The Administration, Faculty, Staff and Student Body join with me in our hearty congratulations to you, your officers and your directors on your long and excellent service to this community.

I have taken the liberty of circulating your letter to the Administrative Committee and have posted copies on our bulletin boards.

We hope and pray that the growth of your institution in the next forty-four years will far exceed that of its growth since its incorporation in 1904.

Thousands of Colored Children Can Benefit from School Lunch

Washington, (ANP)—More than half a millon Negro children going to school should benefit from the federal school lunch program.

Last week the department of agriculture allocated $58,800,000 to the states for the program. Congress had appropriated $75,000,000 for the school luneh activities.

Schools participating under this program will give children free or at very little costs a more nutritive lunch. Negro children, particularly in the south, should benefit because the law says:

"If a state maintains separate schools for minority and for majority races, no funds made available pursuant to this act shall bc paid or disbursed to it unless a just and equitable distribution is made within the state, for the benefit of such minority races, of funds paid to it under this aet."

What does a school do to be ineluded on this program? Any interested community group such as a parent teacher association, service club or other civic group may work with school offiicals in starting one. A school board or official must be the sponsor.

The sponsor must operate the lunch program at the school. He provides facilities for preparing and serving the food as well as getting the additional funds needed for the program. Funds spent on these dctails will be matched by federal money.

If children are able to pay, a small amount may bc charged, but no ehild shall be refused or diseriminated against because he cannot pay. Money collected here may also go toward matching the federal funds.

To be eligible a school must be a non-profit organization, public or private, of high school level or below. Schools should apply for the benefits of the program through thc state agency designated by the governor.

How are schools reimbursed for the program? The amount received depends on the type of lunches served to children. Food served teachers and other adults may not be included.

The sponsor makes an agreemcnt with the state agency. Food is purchased monthly by the sponsor, and he is reimbursed monthly according to the provisions of thc program.

Three types of lunches are served, type A, type B, and type C.

Type A lunch is the most complete lunch and will bring the greatest reimbursement. It provides for each child a half pint of whole milk, two onuces of lean meat, poultry, fish or cheese, or one egg, or one half cup of dry beans or peas or four tablespoons of peanut butter.

It also includes three fourths cup of vegetables or fruit or both, one or more pieces of bread or muffins and two teaspoons of butter or fortified margarine.

Grade B lunches, which contain two thirds as much food as type A may be served if the school does not have the proper lunch room facilities. This lunch should be supplementd by food from home.

At the same time schools, whether receiving or not receiving reimbursement, may also request foods from the agriculture department's underprice- support activities made available to schools.

For complete information on the school lunch program a school may write its state department of education or to the U. S. Department of Agriculture, Washington, D. C.

The School Lunch act as it operates today was passed June 4, 1946. Funds are appropriated to the states, the District of Columbit, Alaska, Rico, Hawaii and the Virgin islands. Allocations for the fiscal year of 1949 amount to $1,399,047 for Oklahoma.

It costs just as much to feed a rooster as it does to feed the best producing hen in the flock; he is therefore a non-paying boarder unless the flock is kept for hatching eggs. Non-fertile eggs keep longer and demand a better price on the market.

Cover crops offer one of the best ways of increasing yields of other crops used in a good rotation. Now is the time to prepare land and purchase seed and fertilizer for seedings during the last half of August and September.

Farmers May Receive 65 Per Cent of Cost of Seed for Cover Crops

Farmers in Tennessee may receive as much as 65 per cent of the cost of seed used in seeding winter cover crops through the Agricultural Conservation Program, Carl Fry, chairman of the state committee said today. This payment will come in a reimbursement at the end of the program year, Fry said.

"Farmers carry most of the conservation load themselves since they furnish the labor and part of the cost of the seed, but the assistance they get through the Agricultural Conservation program may be that extra push needed to get the job done," he said.

Fry pointed out that land in Tennessee, especially, is subject to severe erosion if left uncovered during the winter months. "Tennessee slopes from about 6000 feet in the east to only about 200 feet in the west. This causes erosion in itself but when hard rains and erodable soil are added, we have a situation that must have careful attention or we shall soon lose the remaining part of our good topsil. Much of it has already gone, or is going, as is testified by our muddy streams after a hard rain, but we can hold what we have left, and rebuild the damaged areas by the use of cover crops," he stated.

Seed may be obtained through purehase orders in most counties. Farmers who wish to obtain seed in this manner should contact their local Agricultural Conservation Association, Fry added.

Opening of New Tractor Plant to Relieve Shortage

Farmers may look forward to a larger supply of farm tractors during the next 12 months. The present supply will be further increased by the opening of the new Ferguson plant in Detroit.

The Ferguson System tractor was formerly manufaetured by the Ford Motor Company.

The new assembly line will add thousands of new tractors to the short supply when the plant begins operating iu the next few weeks. Known as the Harry Ferguson Company, the plant is said to be one of the most modern of its type in the country.

Beginning today the company will conduct a two weeks' training school for its southern dealers at the Classification Center on Thompson Lane.

Many bushels of quality potatoes are lost annually from the family food supply becausc they sprout and become shriveled. It is only natural for the potato to sprout after it has passed through a rest period. That period will vary with different varieties, but it is usually from two to four months.

Sprouting can be prevented or at least reduced to the point that the potato won't be damaged. A chemical dust sold under the name "sprout inhibitor" or a similar title will prove very effective if applied before the potato completes the rest perid.

For a crop dug in June the dust should be applied by September.

One caution farmers must take —don't apply the new dust to seed potatoes because if you do you will be sorry. They won't come up.

Soil Improvement

It is a good farming practice to grow winter legumes every year. Farmers need to grow them now more than ever before. Nitrogen will probably be more scarce in 1949 than it is this year.

Make Farms Hum

By Grace Armstrong Allen

How mechanically some people work, their eyes fixed on the moment only, simply getting the job done, day after day. But not farmers. Before they reap, they sow. Beforc they sow, they plan and prepare. They are always looking forward, from month to month, from season to season, from year to year, in simple prosy fact, yet poetic with the rhythm of life, today's work on the farm grows out of yesterday and heads toward tomorrow.

So beekeeping, like other farm work, calls for plans. And, like other farm work, the plans themselves are often modified or completely changed by circumstances, espeeially weather. So our beekeeping rules cannot be rigid. Right now, for instance, what is going on in our beeyards? Whether bees are or are not still gathering nectar depends on various factors. especially weather and the condition of local plants.

So we cannot say: Always in August do this or that specific thing. You may be exultantly taking off a second crop; or you may be disconsolately removing empty supers. But we ean say —and I hereby do say, emphatically: Always in August be looking forward to fall—and past fall. through winter, on toward next spring.

Because for many years beekeepers have loudly, increasingly, and wisely stressed the need of generous wiuter stores, beginners may think that is the entire secret of both wintering and starting the next year. It is a vital part, but only a part. What we must especially think about in August is queens. It is absolutely essential to have a large population of young bees in the fall; so it is absolutely essential to have vigorous young queens able to produce these bees.

If we were to make a graph of seasonal brood-rearing, we would find the curve of egg-laying swinging sharply up in spring, reaching its peak usually in early May. Then it would drop for mid-summer. But a second curve starts in late summer or early fall, a much gentler, less ambitious curve. This is naturally stimulated by a good fall flow; but it is also a natural activity of bee life, for bees themselves look forward toward the future.

So if you have colonies with old queens (for instance, that swarm you hived), eolonies that produce little or no honey when others around them did well, colonies that have just loafed along through the summer, getting neither populous of prosperous, think forward to this fall and next spring, and do something about it.

But don't ask me if August is a good month to requeen. My only answer is double-barreled: yes and no. If there is a reasonably good flow, yes. If there is a dearth of nectar, no, definitely no. If you think you'll have a flow later, wait till early September. But make your plans now.

So far our own crop is so small that we like to change the subject. when we think some one might ask us what we averaged. But what we did get came from locust. And locust came unusually early. Suppose our bees had come through the winter weak, and had not started building up promptly. Would they have rolled in that locust honey, back there in April? That answer is definitely, no.

Let's follow through for just a minute on this queen business. We need good young queens at this time not only to give us plenty of young bees in fall, to carry through the winter; not only to begin vigorously to build up colony strength in the spring; but also to discourage swarming next year. Many beekcepers through many years have become convinced that old queens are far more apt to swarm than young ones.

So if you have a lot of old queens, August is a good month to think about re-queening. That is one vital factor in making our farms hum.

How to Avoid Rabbit Fever

There were twenty-three cases or rabbit fever in Alabama last year. This information comes from a radio talk on September 16 by Dr. John M. Gibson. Dr. Gibson is Director, Division of Public Health Education in Alabama.

Of course, he traced the history of the disease and told how people catch it. The proper name for it is Tularemia. Wild rabbits catch it from being bitten by an insect which carries the germ in its system.

Persons handling sick rabbits may catch the disease through a break in the skin.

If you observe the following you may avoid catching rabbit fever:

1. Watch the movements of wild rabbits that you may be about to shoot. If one appears to be slow of movement, don't kill it. Or, if you do shoot it, handle the carcass with care (this will be discussed in a moment) and bury it. In this way, you may be removing a source of infection to some other hunter.

2. Use rubber gloves when handling rabbits or other animals. This should be done whether they are dead or alive.

3. Wash the hands jthoruoghly after handling rabbits, even if you have handled them with rubber gloves.

4. Keep your hands away from your face whenever you handle wild rabbits.

5. If it is not too expensive, burn everything that has come into contact with wild rabbits or other game. If it is too expensive to burn sterilize it, if possible.

6. Avoid flees or ticks that may be infected with tularemia germs. Be particularly careful to prevent them from biting you.

7. If a broken place in your skin is likely to come into contact with a wild rabbit, use a good disinfectant on it. You should be warned, however, that this procedure does not guarantee protection.

8. Whenever you eat rabbit meat, at home or in a restaurant, be sure it is well cooked. Heat kills tularemia germs. See that it is cooked until all red juices have been eeeked out. (Be sure there is none left around the bones after it apparently has been cooked out of the rest of the meat.)

The high price of meat may cause many Alabamians to turn to the old fashioned rabbit box or shotgun to supplement their families' meat shpply this winter. This can be done with safety if they are properly careful about tularemia. A little forethought is all that is needed.

"A Mighty Effort"

As General Eisenhower once said, "Citizens, community and nation must join to help defeat the menace of fire. . . It is a mighty effort involving all our citizens, and covering every area of our social and economic life. Fire . . . must be controlled if the economie structure we have built is to be free from the threat of recurrent destruction."

The citizen's duty in this regard is plain. It lies in keeping his property to high standards of fire safety. That means care in the handling of cigarettes, explosive fluids ,an dall other flammables. It means a clean and orderly home and place of business, without dangerous accumulations of trash. It means thorough maintenance of heating systems, electric appliance, and other such equipment.

From the community standpoint, fire prevention involves a long range program. The National Board of Fire Underwriters has summed up some of the necessary projects. They include better building construction, better fire safety laws and enforcement, better fire prevention education in schools, better water systems and better fire fighting services. All of these goals can be attained by any town—and the cost will be repaid time and time again in the lives and property that will be saved from destruction.

What it all adds up to is that we can lick fire—if we have the will to do it.

Film Strip to Depict Highlights of First Southwide 4-H Club Camp . .

A film strip showing the highlights of the first Southwide 4-H camp, biggest event ever held for rural colored youths, is being prepared by Extension Service for use in the various States, Extension Director M. L. Wilson announced this week.

The eight-day encampment which was held at Southern university. Baton Rouge, La., closed on August 31. Eighty-two 4-H delegates from 15 Southern States were in attendance.

Events taking place from the moment of the arrival of the delegates at the encampment to the impressive candle-lighting ceremony, which marked the close of the outstanding camp, have been chronicled in color. As soon as the film strip is edited and processed, copies will be sent to all the participating States.

The film strip shows all the myriad activities in which the 4-H boys and girls took part during the encampment. Those included hearing such speakers as Director Wilson, Dr. Marshall Shepard, recorder of deeds for the District of Columbia, Miss Patsy Graves of the Farmers Home Administration, and David W. Kellum of the Chicago DEFENDER.

The activities also included joining in a talent night program with Frank "Sugar Chile" Robinson, and watching a flight demonstration by a detachment of flyers from Col. B. O. Davis' Lockburne Fighter Group.

Other important encampment highlights recorded in the film strip are scenes showing the 4-H'ers in the beautiful Louisiana State Capitol building, visiting historic places in New Orleans, boat riding on the Mississippi river, observing research work at the Louisiana State Experiment Station, and taking part in various recreational activities on the campus at Southern under the direction of Dr. Ross C. Owen, physical education specialist.

Director Wilson says the 4-H delegates will find the film strip of real value as an aid in describing to home community folks what went on at the encampment.

Without Under-Understanding"

Men whose motives are of the best may unwittingly undermine a nation's liberties. The late Mr. Justice Brandeis, one of the greatest of liberal purists, touched on this when he said: "Experience should teach us to be most on our guard to protect liberty when the government's purposes are beneficient. . . The greatest danger to liberty lurks in insidious enchoachment of men of zeal, well-meaning but without understanding."

Many specific examples of this could be cited here and abroad. And one current example, whose importance may not be widely realized, lies in the aggressive campaign to force compulsory medical insurance on the country. Those who favor it say that it is not socialized medicine. Yet, as history shows, whenever the government dominates the practice of medicine, complete socialization always follows.

Lenin, who was certainly one of the world's foremost authorities on totalitarian techniques, once said, "Socialized medicine is the keystone to the arch of the socialist state." That is completely logical. For under socialism, the state must be top dog in everything—including the standards of medical service the people are to receive. Regimentation must be complete if it is to succeed.

The fight against the destruction of private medicine is simply part of the larger fight to guard our freedoms. Justice Brandeis went to the heart of the matter when he warned against "insidious encroachments by men of zeal, well-meaning, but without understanding."

On the Firing Line

The retailers of the country are making a real effort to hold prices down. Evidence to that efforrt is found in secret operating statements of a number of chain systems. Dollar sales are well up as compared with the same period a year ago. But net earnings have substantially declined. The reason: wages and other operating costs have risen, and have not been offset by corresponding price increases.

This is in line with the long-established policy of the chain store industry to sell goods on as low a margin as possible—and, when it can be done, to absorb price increases without passing them on to the buyer. Thousands of independent stores have been following an identical principle. The result has been to save the consumers an enormous sum of money.

Some may question this, by pointing to the fact that prices have risen. But that has happened in spite of—not because of—the pricing policies of American retailing. Store operators are practical men. They are shaving profit margins razor thin to sustain volume sales which are the lifeblood of modern mass distribution. And mass distribution is essential to the high living standards enjoyed by millions of consumers. However, retailers can't run at a loss and pay the wholesaler and the landlord and the tax collector. Most stores are operating just about as economically as is humanly possible. Therefore, the ability of retailers to absorb price boosts is limited.

Even so, the resistance of retailing to runaway inflation is one of the encouraging signs of these confused times. And so are other phases of retailing's work in the interest of the public—such as cooperation with producers to improve qualities. The storekeeper is on the firing line. But he is doing a good job in the face of obstacles.

Control Garden Insects

Fall webworms, cabbage worms, and plant lice (aphids) are bad on fall gardens. Dust as soon as the plants are up to a stand and repeat once a week. Do nont wait until injury is seen. That may be too late. Use the Auburn-approved garden dust if your merchant has it. Otherwise use a derris dust that has 0.75 per cent to 1 per cent rotenone. Do not buy a dust with as little as 0.50 per cent rotenone. Also, keep up dusting on summer garden.

No Cotton Quotas Slated Next Year

No marketing quotas will be declared on the 1949 crop of cotton, according to Carl Fry, state chairman of the Prodution and Marketing Administration Committee.

No quotas will be set, Fry explained, because carryover will not exceed seven per cent of the normal supply of cotton. Since no quotas will be in effect, no referendum will be held, Fry said.

Wash Day Tips

When hanging up the family wash, hang all articles straight and by their strongest part to make them last longer. They will look better and iron easier. These tips come from home economists of the U. S. Department of Agriculture.

Hang garments on the straight of the voods and at bands or other re-inforced places wherever possible. Don't hang them at edges or corners. Pin dresses to the line by seams or waistbands unless they are dried on hangers. Fasten trousers at the waist, but shirts at the tail, because wear at this point will show up least. Always take care to attach clothes pins where they will not pull edges or tear trimmings.

Hang flat articles straight over the line, following the weave of the goods. If the edges are even, they will dry in shape. Place sheets and other large pieces about a third over the line. Sheets are inclined to wear out first along the center so avoid hanging them at this point. Also avoid hanging sheets by the edge which pulls them out of shape Fasten all large pieces in three or four places to save strain. Hang handkerchiefs over the line and pin in the middle instead of at corners.

As soon as clothes are dry, remove them from the line to save unnecessary wear by flopping in the wind. Fold straight pieces straight as they come from the line and place them flat and smooth in the basket. This will keep them in shape and as unwrinkled as possible. This saves extra work in ironing, and makes it possible to use some articles with no ironing.

Russian Cows Don't Worry U. S. Producers . . .

Washington, Oct. 18.—Those "giant" cows the Russians claim to have devcloped will have to grow some more to equal the milk production records set by Agriculture Department experimental herds.

A department scientist said a model dairy herd at Beltsville, Md., includes cows which have topped 3,400 gallons a year and several which have equalled the records claimed by the Russians for their "giant" cattle.

James R. Dawson, chief of the department's dairy field experiment stations, said the 2,420 to 2,640 gallon yields mentioned by the Russians probably were made by selected individual cows rather than by entire herds.

He said that the U. S. records—and probably the Russian—were made under laboratory conditions. The cows, he said, were milked three times a day for the entire year. Normally, cows cannot be milked that regularly.

"We've made no effort to breed giant strains at Beltsville," Dawson said. "Our object is to get high average milk production. And I doubt that the Russian cows are really giants. They're probably big but not giants."

He said that he has made an on-the-spot study of central European herds and is familiar with both types of cattle reportedly used in the Russian experiments.

He said American dairy cows on the average far outstrip central European cattle in milk production. It is estimated that average production per cow in the United States will run about 581 gallons this year.

According to the Soviets' own estimate that Ukrainian cattle ordinarily produce only one-tenth as much as their new "giant" strain, this would mean an average milk production of from 242 to 264 gallons a year.

The Railroads in Peace and War

The railroads are asking the Interstate Commerce Commission for an additional freight rate increase of 8 per cent. The request is made for only one reason—current rate levels are not producing sufficient revenue to meet the carriers' requirements, and to permit necessary expansion at today's wage and material costs.

The public will make a mistake if it thinks this increase is of concern only to the railroad industry. The nation's stake in top-quality rail transportation can hardly be exaggerated. The Army Transportation Journal recently touched on this in a fine editorial, which concluded, "Railroad performance in another crisis will depend upon adequate capacity, which depends upon investment in better railroad plant and equipment, and that, in turn, depends upon earnings or the prospect of earnings. At bottom, then, the adequacy of rail transportation in emeregency depends upon adequate earnings now, and steps should be taken to see that the railroads are placed in a position to make such earnings."

The military services know how vital rail transportation was in the last war—and how vital it will be in any future emergency. And, in time of peace, it is the railroads which move the vast bulk of the produce of farm and factory, make possible an integrated economy, and tie this great country together with bands of steel rails. The "market" for rail service is growing swiftly, and only a comparable growth in available facilities can satisfy the demand. That is why the industry has been forced to ask for higher rates.

Pears filled wth cottage cheese, dressed with mayonnaise and served an a bed of watercress make an attractive, nourishing and delicious salad. Either fresh or canned pear halves may be used

What Time Is It?

Nowadays, there isn't anything very complicated about the time of day. Most of the year the country runs on Standard Time, and during the summer a large section of it moves the hands ahead an hour and switches to Daylight Saving Time. As we cross the nation, the time zones change at established intervals, and in all cases the change is one hour. It's simple enough.

But it wasn't always that way—and it might not be that way yet if it hadn't been for the railroads. Sixty-five years ago Standard Time didn't exist. Every town had its own time, and so, even, did many business concerns. Railroad stations held a confusing series of clocks—each line used the time in effect where its home office was located. Matters went to such lengths, as an example, that in Pittsburgh there were six different times in use. Few people knew what time it really was. You couldn't be sure when an appointment was scheduled unless, by lucky chance, the person you were to meet used thesame time you did.

The railroads realized that something had to be done to bring order out of this chaos. The hundreds of different times in effect throughout the country were a constant and growing headache. The movement to standardize time began in 1872. And eleven years later, on November 18, 1883, every railroad clock was stopped at a given hour. When they started again, Standard Time, with its four time zones, was a going concern in the United States. It was gradually accepted by the people, and 35 years later Congress recognized Standard Time and made it official. The railroads had foreseen an important national need, and through voluntary agreements they furnished a workable solution.

Irreplaceable Wildlife

Once, it is reliably estimated, there were 75,000,000 buffalo in the Continental United States. Now only a few pitifully small herds are left.

Audubon, the great painter of the birds of America, saw literally billions of passenger pigeons, one of the most beautiful of game birds, during his travels. The last o fthem died years ago in a zoo, and the species is extinct.

As all hunters know, the population of ducks, pheasants, quail, and the remaining game birds has been decreasing dangerously. The result has been constantly shortened seasons and decreasing bag limits.

Once the wildlife resources of a country are destroyed, it may be impossible to bring them back. At best, the process takes many years and enormous sums of money. And this is one phase of the government's electric power and land recovery program which needs far greater public understanding than it has so far received.

Some of the greatest streams in the country have been dammed by the government— at an unknown cost in fish. If the proponents of unlimited socialized power development have their way, hardly a watercourse of any size will remain as nature intended it. Again, the vast lakes created by government dams have flooded lands which were once used as resting and feeding areas by migratory game. And, of tremendous importance, the draining of marshes and similar lands has destroyed the nesting grounds of wild fowl—and thus cut deep into this irreplaceable and invaluable living national resource.

The opposition of those who want to conserve wildlife against the indiscriminate development of land and water, at the expense of fish and fowl, is growing fast. And the Federal government, with its unnecessary and badly administered program of socialized hydro-electric development, is among the worst offenders.

Produce all of the corn and grain sorghum this year that you can.

Save all the fall pigs that you can.

Christmas Helps

Our Christmas Exercise Edition
of the
CONCERT QUARTERLY
Is one of the most complete programs to be found. Full of beautiful Christmas Day Recitations, Dialogues, Playlets and Songs. Has no equal. 15c per copy—$1.50 per dozen.

Christmas Offering Envelopes
Artistically designed, produced in four colors, good quality of paper. Size 2½ x 4¼ inches—75c for 100; 250, $1.50; 500, $3.00.

Full from *Cover* to *Cover* of *New Material*
SONGS, RECITATIONS, DIALOGUES FOR CHILDREN OF ALL AGES
Price, 35c per copy

CHRISTMAS BUTTONS
Beautifully lithographed in colors 5c each; 50c per Doz.; 50, $2.00; 100, $3.50.

FOUR PLAYS FOR CHRISTMAS
No. 1, A Pearl of Great Price—for 4 girls; No. 2, Silver of the Second Best—for 5 girls; No. 3, The Year's Great Guest—for 7 characters and 7 groups; No. 4, The Star Garden—for 7 characters and 6 groups—All in one binding; price, 35c per copy.
COME ANY TIME—A Christmas Comedy for 7 girls; price, 30c
WORSHIP THE KING—A Sacred Play—13 characters and chorus: price, 30c.
IN SANTA'S WORK SHOP—A play for children—21 characters. The group may be cut if desired: price, 25c.
HE CAME TO BETHLEHEM—A dramatic presentation for Christmas. May be used as a pageant. Price, 35c.
CHRISTMAS AT JOLLYVILLE JUNCTION—for young folks. A number of characters; price 35c.
CHRISTMAS EVE AND ALL IS WELL—A play in which any number may take part; price, 30c.
THE VISION ETERNAL—A Pageant Story Cantata—for choirs, choruses or selected groups; price 30c.
A CANDLELIGHT PAGEANT—with Familiar Hymns, Dialogues, Pantomime, Processional and Recessional. Price, 35c.

Farm Talk with Farm Folk

By Jesse Safley

June was National Dairy Month. Dairying is the balance wheel of American agriculture and it is fitting for our attention to be focused on this enterprise once each year. Milk and milk products form an important part of the diet of the American people. We seldom eat a meal without milk being a part of it in some way.

People in this country are the greatest consumers of milk—acclaimed by nutritionists as the most perfect food for all age groups. Milk is also important from the standpoint of wealth. In Tennessee alone, milk means nearly $100,000,000 annually. No other agricultural endeavor provides that much income.

Tennessee and the nation have come a long way in the dairy industry. Our milch cows, pastures, housing facilities, ways of transporting raw as well as finished products, processing facilities and standard distribution systems are unexcelled. This has been accomplished in a comparatively short time as there were no cows in this country before the first white men and for many years afterwards.

During June many stories, radio programs and public addresses praised the milk industry. This is all good, but the greatest advantage might come from an analysis of the industry from the production end to the consumer to determine if we are getting the greatest possible returns.

Tennessee dairymen are milking some of the highest producing animals in the world, but at the same time some are milking the lowest producers. Many poor producers are kept because some dairymen believe that profits come only with numbers.

Low production records are not always the fault of the animals. Herd, pasture and feed management play a vital part in any dairy program. Many farmers don't realize the value of good pastures. Others are showing good incomes from lands once considered no longer good for farming purposes. They are not only providing good pastures for their herds, but the land is being restored to its natural fertility. .

Some cows produce 1,000 pounds of butterfat while others are producing 100 or less. This is proof enough that some farmers are not receiving maximum returns from their herds.

Low production may be the result of a number of things other than feeding and breeding. Often diseases and insects are allowed to run rampage through the herds. Many dairymen conduct a haphazard program of breeding, which results in excessive production some times and low production at others. This not only means an unbalanced monthly income for the farmer, but he profits less when the supply is above normal.

Another important and often neglected phase in milk production is the care of milk from the time it is taken from the animal until it reaches the milk plant. Improper care results in losses totaling thousands of dollars annually in Tennessee alone.

Manufacturing of milk into a score or more products has been developed into a major industry in Tennessee. Products from state plants are distributed throughout the nation.

Consumption of milk, cheese, ice cream and other dairy products is now at a record high in Tennessee, but the maximum has not been reached and won't be until more importance is placed on the quality of the product offered for sale.

Tennessee has recently gone through one of the longest wild-onion seasons in recent years. It cost the dairy industry thousands of dollars in reduced sales. Consumers are not going to buy milk, butter, cream, ice cream and other products with off flavor, especially if that flavor is onions. It is understandable for a plant to let a little off flavored milk get on the market but to continue to do so week after week is wasteful. This practice results in a loss to all. Consumers say little about it. They just stop buying milk and butter and often switch to other products.

However, some customers are not mindful of the true value of milk in the diet. Many have complained at the high price of milk and butter, but they should realize that a quart of milk daily will provide half the amount of nutrients needed for the average daily diet. It is for this reason that milk is still by far the cheapest food on the market.

The dairy industry can justly boast of its accomplishments and there isn't any doubt that our state and nation will continue to progress with this leading agricultural enterprise. Some of the outstanding farmers and leaders of our nation are engaged in this industry.

If all involved would seek and attempt to attain all possibilities offered through dairying during the coming month we could look back years from now on June 1948 as the month of all time in agriculture.

Expert Warns Against Over Cultivation

Perhaps the worst sin committed against horticultural crops throughout Tennessee is over cultivation—resulting in root pruning, J. J. Bird, associate horticulturist of the University of Tennessee, said today.

"This is especially true with such crops as potatoes and tomatoes," he said.

Bird, who has spent much time during the past four years working directly with the farmers who produce tomatoes and potatoes for commercial purposes, said proper vine growth is seldom found in potatoes which have been heavily fertilized. He explained that there is always evidence of the plants being root-pruned through deep and unnecessary cultivations.

"It is especially important that such highly intensified crops as the potato and tomato be given every protection since the investment in this crop is high and the risk is great," Bird said.

"Plants which have suffered root disturbance will not attain maximum growth and the lower leaves will turn yellow and drop off sooner than otherwise.

"Deep cultivation is not necessary and should never be practiced near the row. After the plant has reached a growth of eight to 10 inches only shallow cultivations should be made.

"When plants make a rapid growth there is little harm from weeds. The growth can be hastened through the use of a heavier application of fertilizer and the control of insects and diseases."

Bird recommended frequent, shallow cultivations with the "Gee-Whiz" or 14-tooth cultivator in the case of tomato production.

Whether vegetable crops are produced for home or commercial purposes it never pays to over cultivate them, Bird concluded.

Community Improvement Contest Launched in Rural Tennessee

Organized communities throughout Tennessee will compete this year in a State-wide Community Improvement Contest, reports W. H. Williamson, assistant state agent in charge of agricultural extension work among colored farmers.

It is expected that every county in the state will be represented in the community effort which will stress farm and home improvement. Also, the contest will be aimed at encouraging and stimulating rural families to work together for a system of farm, home, and community management. Among other things, steps will be taken to assure increased production of food to provide an adequate diet for every family; develop and improve sound farming and homemaking practices; discuss and reach solutions to community problems.

South Forges New Type of Agriculture Says Top Extension Service Official

A new pattern of agriculture designed for better rural living is being forged in the South, said H. H. Williamson, assistant director of Extension Service in an address last week before 500 Virginia colored farm people.

He was speaking before the two-day session of the 23rd annual meeting of the Virginia State Advisory Board in Mecklenburg County, Va. Representatives from 41 Virginia counties were in attendance. They had met to appraise their 1947 achievements in farm and home improvement, and to make plans for another year.

Other speakers on the program were: Mrs. Ocie O'Brien, home management specialist of the Farmers Home Administration, J. W. Hudson, president of the Mecklenburg County Advisory Board, Miss E. Alice Hobday, home demonstration agent, and Farm Agents N. D. Morse, and J. M. Johnson.

The State Advisory Board works closely with the Extension Service program in promoting better farming practices and higher standards of living. T. L. G. Walden, a Nansemond County farmer, is president of the board. Ross W. Newsome, who heads up extension work with colored farmers in Virginia, assists in directing the program of the organization.

Assistant Director Williamson's address followed county by county reports of accomplishments in farm and home improvement. The improvements reported included increased farm ownership, building and repairing of homes, installing electricity and running water, and expanding live-at-home activities.

"The cold statistics on your improvements, said Williamson, "do not carry their full significance when they reach Washington. But here on your home ground, they mean the discarding of the old dim oil lamp, and end of the long trek up the road to the well to get water; they mean bathtubs and restful nights undisturbed by rain leaking through the roof; they mean better living, healthier, happier families—the real goal of extension work," he said.

Continuing, Williamson declared, "It's the work of groups like yours that is developing a new pattern of farming in the South. Another group that is making an important contribution to this drive is the 4-H organization. In the South, there are about a million 4-H'ers. A third of these are colored. Their projects in increased farm production and better homemaking is a vital force in rural life improvement.

"The real core of the new pattern of agriculture is balanced farming," the assistant director asserted. "In a nutshell, that means carrying out the type of farming program which provides a variety of sources of income—not putting all your eggs in one basket," Williamson emphasized.

Another important feature of the meeting was a tour of two farms to observe how improved farming and homemaking practices are being carried out. On one of the farms, the board members saw how Mr. and Mrs. McKenzie Talley had developed their 200-acre dairy farm into a $15,000 a year business. On the other farm, they saw how Mr .and Mrs. J. J. Lewis had expanded a few grape vines into a 5,000-gallon yearly bonded wine enterprise.

Winter Grazing

You should grow winter grazing for all your livestock—the family milk cow, beef cattle, hogs, sheep, poultry, and workstock.

August is the time to plant crimson clover and ryegrass for winter grazing. Oats and vetch may be planted in north Alabama the last of August. Plant in middle and south Alabama during September. Disk land where Caley peas are to be seeded. This will give it time to settle to a firm seed bed before planting.

Expects Farm Population to Decline 13 Percent by 1975

While the total population of the United States may increase by nearly 30 million in the next quarter of a century, the farm population would decline by about 13 per cent, if past trends continue, said Oris V. Wells, Chief of the Bureau of Agricultural Economics, in a talk recently on long range trends affecting American agriculture before a conference of radio farm directors.

Wells pointed out that under favorable economic conditions, farm output might climb as much as one-fourth by 1975. Even with less favorable conditions, he said, production would probably still increase at about the same rate as the total population.

These gains, he explained, would stem from further mechanization of farm work which would probably release some 15 to 20 million acres of land from the production of feed for workstock and from the use of better seed varieties, more fertilizer, better control of pests, better livestock management, and improved farming practices generally.

The BAE chief said that the average size of farms will continue to increase. In recent years, the average acreage and output of commercial farms has risen, while the number of farms has fallen off, he asserted. Pointing to the increase in part-time farming of small acreages, Wells said that this trend is likely to continue, especially if a high level of employment is maintained.

What the Railroads Charge You

Just how much do railroad freight rates influence the cost of living? They are a factor, of course—but a far smaller factor than is generally realized.

The Interstate Commerce Commission has made a report on the subject, which says that total railroad freight charges in 1946 amounted to less than 5½ per cent of the wholesale value at destination of all commodities so shipped. This was the lowest percentage since 1928, when the reports started.

Another conservative estimate holds that less than 4 cents out of each dollar spent last year on living expenses by families of moderate income went for rail transportation—including not only freight, but passenger fares, mail, etc.

The fact is that commodity prices in general have gone up faster and farther than freight rates. The average revenue received by the railroads for hauling a ton-mile of freight has risen only 34 per cent as compared with 1939. The costs of most goods, on the other hand, have nearly doubled since then, and many have tripled and quadrupled. Putting it another way, the increase in average prices which railroads must pay for what they buy is about twice as great as the increase in the prices for which they may sell their services. And it is certainly hard to see how anyone—except railroad stockholders — can complain about that.

Railroad service is ever improving. And we get it for a tiny portion of what we spend to live.

Farm Fires Claimed 3,500 Lives in 1947

Farm fires claimed 3,500 lives and destroyed over 100 million dollars worth of property last year, said Secretary of Agriculture Charles F. Brannan in announcing that Fire Prevention Week will be observed October 3-9.

Poor stands of cotton cost money because you can't pick cotton in skips. If you have a good stand, keep it. Ieave enough cotton to have two or three stalks per hill, 15 to 18 inches apart, at laying by time, says O. N. Andrews, Extension Service cotton specialist. seedof, .

Chores of Farm Woman

I was right proud of myself the other night—for a while! My bedside alarm clock seemed to go into a coma and wouldn't tick for oil nor shaking. I knew I couldn't make it any worse, so I delved into the kitchen cabinet drawers for a screwdriver and a pair of decrepit pliers that I try to keep carefully hidden from the men folks on the farm, and with a couple of saucers to catch screws, bolts, washers and such other intestinal contents as a clock might contain, I gave my undependable ticker the major operation of its existence.

Somewhere down in the depths I accidentlly touched something that made the wheels start. I'll never know what, but I guess an accidental fixing is as good as an intentional fixing if it works. I turned the carcass over on its back, its bottom, its top, and it kept on running, so the natural conclusion was that the operation was a success. Then I carefully began to put screws, bolts, rings and other gadgets back into any place they chose to fit. The clock kept on running.

And do you know—and this is what I'm proud of! I got that whole clock put back together and had only two screws left over! The clock ran for two hours before it missed the parts, then it quit again. But the point is that I got two hours free time and a couple of screws and one washer for the hour and a half of time and pains spent on the operation. Of course, those won't buy a new clock, but I still feel that the results of the job might have been different if the "patient" had wanted to be co-operative.

Oil's "New Look"

The oil industry, according to an authority on its operations, has acquired a "new look." That didn't come about suddenly, for reasons of style. It was the result of an evolutionary, development which has caused far-reaching changes in oil's importance to the American people and American industry.

Not so many years ago oil was primarily a one-product business, and that product was kerosene. Thereafter, most of the industry's work had to do with producing more and better gasoline to meet the needs of the automobile age. Now, in this complex postwar world, it is clear that a very high percentage of all the energy needs of the world must be met with oil and natural gas.

A few figures vividly illustrate what has happened. Many people think that the millions of cars, trucks and buses which throng our streets and roads are the greatest users of energy—yet the fact is that they use only 10 per cent of the total. The railroads use 11 per cent. All our merchant ships and all our planes use together less than 3 per cent.

The really big users of energy fall into three groups. First come the public utilities, which account for 37 per cent of all the energy consumed. Industrial manufacturers use 16 per cent. Finally, heating in homes and places of work takes 24 per cent. The use of oil for space heating alone has gone up 50 per cent in the last two years.

Here, in brief, is the background of the increrdible demand for oil today. Oil's "new look" is indicative of its immense influence on our civilization.

This Kentucky Farmer Believes in Ladino Clover

Kentucky—home of the nationally famous Kentucky 31 fescus grass—has one farmer who believes in Ladino clover.

He is Otis Profitt of Monroe. Co.

Profitt maintains that his three acres of clover provide an abundant pasture and he rates this crop above orchard grass and red clover mixture.

Some 300 cre of ladino clover will be sown this year in Monroe County

WOMAN'S PAGE

KEEPING HOUSE

by Norma Crane

FAMOUS HOME ECONOMIST

"A step in time saves nine" may be the streamlined version of an old proverb, but it is applicable to all homemakers. Step saving devices eliminate many kitchen problems. Here are some hints to help cut the mileage off your culinary duties. That old dressing table in the attic can be repainted and covered with oilcloth to provide an excellent utilty table next to the stove for meal preparations. __Pots and pans scrubbed bright and clean make attractive decorations on the wall above the sove when lined up in graduating sizes. It also keeps them so handy. Soaps and washing utensils find their place in an under-sink cabinet made easily out of an orange crate ____A pad and pencil attached to your pantry door will help you keep a check for those shopping tours_____

RECIPE OF THE WEEK

Cucumber Hollandaise Sauce (For Fish Meals)

1 cup butter or oleo
4 egg yolks
2 tablespoons lemon juice
1-8 teaspoon salt
Dash of Cayenne
1 cup chopped cucumber, drained

Divide butter or oleo nto three equal parts. Place one piece in top part of small double boiler. Add egg yolks and lemon juice. Place over water that is just below boiling point and stir constantly. When butter is melted add second piece of butter and as mixture thickens, add third piece, stirring while cooking. Cook only until thick. Remove from hot water, add seasonings and cucumbers, serve instantly with baked or broiled fish and vegetables.

LAUNDER AWHILE: Don't make just enough starch for one week's use. While you're at it you might just as well make a quantity and bottle it for several weeks ahead. It will keep well in a cool place.

PARTY LINE: A drop of jam below and above the ice-cream scoop topped off wth whipped cream for party serving will turn a simple dish of cream into a parfait.

REFRIGERATOR HINTS: To defrost quickly remove food, fill ice-cube trays with hot water, place in freezing compartment after machine is shut off and close door tightly____Left-over party sandwiches saved for the next day's lunch will keep well in the refrigerator if wrapped in a damp towel.

YOUR PRESERVES: Keep an inventory of your preserves in the back of your budget book and how much to prepare for the year. next season you will know just how much to prepare for the year.

KITCEN BRUSHES: Wash dish and bottle brushes, immediately after use. in warm soap suds and rinse in cold water__Keep a small paint brush handy to get at the dust in cabinet corners__Do not sweep the floor if spattered with water, mop up first with cloth and let the floor dry_____ A sterilized brush with aluminum handle is excellent for brushing egg yolks on bread and biscuit tops.

LUNCHEON MENU

Stuffed Tomato Salad (Scoop out tomato—add scoopings to chicken, meat or salmon salad—refill shell)
Raisin bread slices with cottage cheese.

TIME TABLE: Boiling 20 to 30-Minute vegetables—Amount of Water Used

Beet Greens	Full Pan
Carrots	One cup
Whole Cauliflower	Full Pan
Celery	One Cup
Swiss Chard	Almost no Water
Dandelion Greens	Full Pan
Sweet Potatoes	Water to Cover
Turnip Tops	Full Pan

"It's not the work, it's the futlity," writes a tired young housewife. "Everytime I set up a system for my home, something happens and bing!—no budget and no system." Too many housewives bog themselves down with a set routine and try to run their homes like an office. Then the price of meat rises or baby gets a cold and there goes the routine and the nerves of mother. It all comes down to this. Set an elastic routine for yourself, one that will take the little upsets common to every home. A study of the art of homemaking wll ease the problems which might upset your standard of living. Be prepared for that burned dinner, or the price rise, or the breaking down of the washing machine. Don't expect things to run smoothly all the time Adopt the motto, "Imagination, Humor, Faith and Determination," pply it to your day to day living nd you can't help but enjoy the areer of homemaker.

CHEESE AND RICE SOUFFLE

ahO_____
-4 cup rice
2 tablespoons butter
3 tablespoons flour
3-4 cup of milk
2 cups (1-2 lb.) processed American Cheese
4 eggs separated
1-2 teaspoon salt
Dash pepper
1 1-2 tablespoons chil sauce
1-4 teaspoon garlic salt or onion salt (if desired)
Dash of paprika

Wash pick over the rice and boil t. Melt the butter in the upper part of the double boiler when mooth stir in the flour and a litle of the milk to form a smooth paste. Add the remainder of the milk gradually and then stir in he cheese (thinly sliced) until melted. Beat the egg yolks and dd the seasonings. Stir into the heese mixture and then fold in he cooked rice. Beat the egg whites until stiff and then fold gently into the cheese and rice nixture. Bake in a greased casserole dish (1 1-2 qt. size) at 325 degrees F. for 40 minutes. Serves 4-5.

GADGETERIA: A manufacturer has just produced a new floor waxer with a tray that holds either steel wool pads or a sponge so he tool can be used for both preliminary cleaning and waxing___ A new plastic tape for Venetian blinds has no surface pores to trap dirt or grease____Five-in-one kitchen shears that will cut regetables open bottles remove screw tops squeeze juice and even work as a screw drver____A paper covering material that can be sewed like cloth and wiped off when dirty, comes in pastel shades, deep colors____A portable heating unit about the size of an egg-beater, singes chickens, browns casserole dishes, grills cheese sandwiches, defrosts the refrigerator, removes paint and dries clothes____A new thimble with pocket in the crown to seath long fingernails is the first major improvement in thimbles for many years.

HINTS:Little holes in net and lace curtains should be darned whle the curtain is still wet. This eliminates pulling and after the curtain is stretched the repaired part returns to its original shape. skirts for growing youngsters should be basted lightly rather than hemmed to make lengthening easier. When turning a shirt coltar make off the original stitching lines on the worn part with pencil then just follow the marks___Instead of sewing in shoulder pads, attach them to the dress with snaps so that they can easily be removed for cleaning.

Adventures in Good Eating

By Duncan Hines

This cooked dressing is good when mixed with odds and ends of baked or boiled ham for a sandwch spread. It is also excellent on slaw.

Put into a double boiler 1 cup of very thick sour cream, 1-3 cup milk, 1-2 cup vinegar, and 3 egg yolks. Mix together. Blend together 1 tablespoon flour, 2 1-2 tablespoons sugar, 1 teaspoon salt, 1 teaspoon dry mustard, 1-2 teaspoon celery seed, and add to the above mixture. Let cook until thick. Grated onion to taste may be added if desired.

When the ground ham is placed in the refrigerator, it should be put in an uncovered contaner, as it will mold quickly if covered. To be mixed with the dressing as needed.

(Released by the Bell Syndicate)

DID YOU KNOW?_____?

That the high chair has become the low chair? Baby's new safety chair looks like a small low card table on wheels with a seat in one corner. It suspends the baby in a seat fixed in the gavity center of the table and given more than enough room for him to play and eat. Mommy gets a small foldng chair with the set so she can sit down to feed him__That adding a little salt to egg whites helps them to whip up into a nice fluffy peaks?__That very young children need a certain amount of finger food? This encourages the appetite and does much to avoid the "won't eat" problem. It cuts down feeding time and is good for the development of teeth.

RECIPE OF THE WEEK:

"Sunday Best" Ginger Bread

1 package gingerbread or ginger cake mix
1-2 cup granulated sugar
3 tablespoons cornstarch
1-4 teaspoon salt
1 tablespoon grated lemon rind
2 cups boiling water
4 tablespoons lemon juice
1 3oz. package cream cheese

Prepare the gingerbread according to the directions on the package. Make the lemon sauce by combining sugar, cornstarch, salt and lemon rind in saucepan. Add the boiling water gradually, stirring constantly. Remove from stove and add the butter and the lemon juice. Cut a generous amount of the cream cheese and put on top of each square of gingerbread. Serve with the hot lem on sauce poured over it.

MAKEUP: One fresh start on makeup during the day has more face value than constant patching up ____Apply morning makeup in the daylight rather than under electric light. This can be done by placing a hand mirror against the window and sitting before the window___Powder should be lightly and evenly applied and practically not used at all where it is apt to clog the pores. Take a second look at your lipstick. Does it still harmonize with your complexion now that "Old Sol" has been shining down on you? Maybe a change in color of your lipstick would do more for your looks than you'd ever dream it would.

FARM FED CHILDREN VS. CITY FED CHILDREN: General Mills recently made a survey on the diets of children living on farms and in cities. Believe it or not the results proved that although the farm may be the source of hearty, wholesome food, only 27 per cent of country children have good diets as compared to 42 per cent of the city children. How well are your children being fed? Better check the "Wheel of Good Eating" which describes the 7 basic foods for a balanced diet. Drop a post card to the United States Department of Agriculture, Washington, D. C., requesting this free aid to your child's health.

CLOTHING: Among your best buys this season are the gold shoes, belts and bags which are featured as summer and fall accessories. They are suitablt for day and evening wear during these seasons and for dressy occasions during the winter months, especially those with long flowing sleeves, are definitely out of place in the kitchen as they ignite easily. You're looking for trouble when you wear them while cooking. Save them for lounging or for company; wear instead, practical short-sleeved garments.

Snack Is Helpful Between Meals

You boys and girls had better check to see if Mother okeys it. Miss Mary Hulsey, Extension Service nutritionist, is sure that a bite or so between meals is good for you.

In fact she says these bites may be healthful snacks. Growing boys and girls when spending long hours at work or play, may need something between meals. A glass of milk, a sandwich or a hard cooked egg is good. Fruit also helps to keep one's energy up without spoiling the appetite for the next meal, says Miss Hulsey.

But no candy, cakes, or a sweet drink shortly before a meal. "That, of course spoils the appetite for vegetables and other esential foods" says she.

Nitrogen Increases Income on Tobacco

Intests at the Agricultural Experiment Station at Lexington, applications of varyng amounts of nitrogen increased returns from tobacco, when not more than 150 pounds to the acre were applied Additions of 50, 100, 150 and 200 pounds of nitrogen to the acre were tried. Increased returns were received up to 150 pounds. There was little difference in returns when 150 and 200 pounds to the acre were used.

COTTON INSECTS

The most important job for cotton farmers this month is to keep up with the bugs in their fields. Get your guns greased up and plenty of poison to load with. But, hold your fire until you can see that the cotton is ready to really start making a crop.

In the extreme southern part of the state, dusting, if needed, should be started about June 20. In central Alabama start July 1, and ten days later in the northern part of the state. These are good dates to keep in mind when thinking of dusting cotton

100 Bushels Per Acre Contest in Crenshaw County

Zollie Smith on route 2 Luverne in Crenshaw County made 67 bushels of hybrid corn on one acre last year. By doing so he opened the way for 10 other farmers to enroll in the "100 bushel per acre club" this year.

Farmers who saw Smith's corn got the idea that if he could do it, so could they. The agent left no stone unturned to help these 10 farmers get seed and fertilizer and to give them all of the needed information.

There are 23 acres in the contest. A system of record keeping has been set up. Regular demonstrations will be held throughout the growing season.

The low per acre yield of corn in Crenshaw County makes a con test of this sort doubly important. County Agent, T. J. Foreman, reports that all of the projects are showing up well.

Side Dress Cotton for Highest Yields

Cotton crops that get a side-dressing at the first cultivation after chopping make the highest yields. On this, farmers and agricultural leaders agree.

If you use 500 to 700 ounds of 4-10-7 or 4-10-4 fertilizer under cotton, you will find it pays to side-dress each acre with 100 to 150 pounds of nitrate soda.

Watering Saves Gardens . . .

Many times a dry spell of two or three weeks in June or later will ruin a garden. Farm families having electric pumps or windmill tanks can hold up their gardens during these dry periods. It takes 1,000 gallons to put an inch of water on a spot 40 by 40 feet.

Household Hints

A wide board to fit on top of the regular standard size board scaves time and labor in ironing linens. It will also save time in ironing draperies, men's shirts and other large pieces.

Cattle Flies

The most important job that cattlemen have now and throughout the summer is to spray animals for the control of flies. Spray every month or six weeks. Use one pound of 50 per cent weftable D. D. T. in four gallons of water (25 pounds in 100 gallons). Don't forget to spray barns and other outbuildings at the same time animals are sprayed.

You should wash walls from the bottom up. Water which runs down a wall that has already been cleaned and moistened will not stain.

There is increasing demand for field peas for cannng and for the fresh market. This crop has been a staff-of-life crop on many Alabama farms for generations. It is now coming into its own as a good market seller. Maybe you should include more in your plans for this year.

A small amount of salt in starch will help prevent the iron from sticking. If sticking should occur, the sole of the iron may be cleaned by hubbing it in salt or parrafin while hot. It should then be polished with a dry cloth.

We Wish For All Many Blessings During Xmas Season

THE MODERN FARMER

VOL. XXI. NASHVILLE, TENN., DECEMBER 15, 1948 No. 11

America Will Share With Nations Across The Seas This Year

Franklin County 4-H and Home Demonstration Event

Louisburg, N. C.— On Saturday, November 6, 1948 the Negro 4-H and Home Demonstration Clubs neld their 5th Annual Achievement Day Program at 11:00 a .m., at tne Franklin County Training School. The program was devoted exclusively to 4-H, Home Demonstration and Farm Work. The program included recognition of 4-H Members who were winners in the County and District Contest. Prizes were awarded 4-H Members who completed their projects and passed in record books, and Home Demonstration ladies who were winners in today's Dress Revue and Canning Contest.

Winners in the Dress Revue were Mrs. Marie Johnson, Copeland Perry H. D.; Mrs. Mirth Carroll, Rocky Ford H. D.; Mrs. Mable Reavis, Concord H. D.; Mrs. Nena Edgerton, Mapleville H. D.; Mrs. Emma Floyd, Royal Phelps H. D.; Mrs. Wilma Rodwell, Rocky Ford H. D.; Mrs. Lois Milon, Mitchell H. D.; Mrs. Goldie Davis, Eagle Rock H. D.; Mrs. Elvira Alston, Royal Phelps H. D.; Mrs. Euralee Crudup, Gethsemane H. D.; and Mrs. Myrtle Williams, Rocky Ford, H. D.

Winners in the Canning Contest were Mrs. Mamie Strickland, Cedar Rock Club, (Meat) and Mrs. Elvira Alston, Royal Phelps Club (String Beans).

Guest Speaker was Mr. W. C. Davenport, Wake County Negro Farm Agent. He urged farmers and homemakers to become farm owners. He also stressed the importance of making farm life so attractive that the 4-H Members, the future farmers of Franklin Co., would not leave for urban areas. This could be done by giving the youth proper education since they must compete with modern machines. He also urged the farmers and homemakers to make their homes more comfortable and convenient. Finally he stressed the importance of raising more foodstuff. We wish to express our appreciation to Merchants of Louisburg for their splendid cooperation to our program: Benton and Green Furniture Co., Scoggins Drug Store, Rose's Five and Ten Cents Store, Tonkels Dept. Store, Leggett's Dept. Store, McKinney Bros. and Pennsylvania Motor Oil Co.

The Judges for this event were: Mrs. William Sanders, Jr., Vocational Teacher, Spaulding High, Spring Hope, N. C.; Mrs. E. W. Crews, Home Economic Teacher, Franklin County Training School, Louisburg, N. C.: Miss C. J. Watson, Home Economic Teacher, Gethsemane High, Bunn, N. C.; Mrs. A. B. Branche. Negro Home Dem. Agent, Warrenton, N. C.; Mr. William Williams. Veteran Instructor, Franklin County Training School, Louisburg, N. C.; Mr. Ernest Turner, Veteran Instructor, Franklin County Training School, Louisburg, N. C.; Mr. L. L. Peace, Negro County Agent, Henderson, N. C.; Mr. S. M. Ruffin, Veteran Instructor, Franklin County Training School, Louisburg, N. C. and Mr. T. W. Sneed, Veteran Instructor, Franklin County Training School, Louisburg, N. C.

Approximately 385 men, women and children attended this program.

"Farm Soils" And "Crop Management And Soil Conservation" New Books Are Available

New York — The publication of new revised editions of two popular books dealing with farm soil problems— "Farm Soils" by Edmund L. Worthen and "Crop Management and Soil Conservation" by Joseph F. Cox and Lyman E. Jackson— was announced recently by John Wiley and Sons. Both books have been rewritten and enlarged to make them completely up to date.

First published in 1927, "Farm Soils" summarizes the most recent advances and methods involved in the science of soils. The new fourth edition fully explains such procedures as fertilizing, liming, manuring, draining, irrigating, and tilling as well as methods of soil conservation and management of garden, lawn. and orchard soils. "Crop Management and Soil Conservation," outlining the best modern methods of growing and marketing crops, stresses the adaptation of methods and conditions to the post-war period. In addition to expanded chapters on new crop varieties, seed improvement, farm food production, wild life protection and fish culture, the revised edition includes new material on soil conservation, fertility, new tillage implements, and weed and insect control.

The authors of these books are well-known authorities in their specialized branches of agriculture. Edmund L. Worthen, a fellow of the American Society of Agronomy, has taught soil technology at Cornell University since 1919. Joseph F. Cox. former Dean of Agriculture at Michigan State College, is a prominent agronomist and writer on agricultural subjects, while Lyman E. Jackson is now Dean of Agriculture at the Pennsylvania State College.

Well illustrated and attractively bound, both books offer considerable practical information. They should be on every modern farmer's bookshelf. "Farm Soils" is a 523-page volume priced at $3.20 while "Crop Management and Soil Conservation" has 594 pages and sells for $3.80.

The Spirit of Christmas

By Florence M. Stewart

I sat in my window on Christmas Eve,
It was snowing, and cold and bleak.
An old man, shabby and bent with age,
Was standing across the street.
A woman passed, he held out his hand;
She stopped when she saw him there
And opened her purse and gave to him
What little she had to spare—
And I said to myself, aloud, said I,
"The Spirit of Jesus has just passed by."

Then I saw an old lady stop at the curb,
She seemed feeble, and walked very slow.
The street was crowded with autos and trucks,
And covered with new fallen snow;
Two boys came along, filled with holiday cheer,
And one offered to help her across.
He took her arm and with caution and care,
Guided her feet on the slippery frost—
And I said to myself, aloud, said I,
"The Spirit of Jesus, again has passed by."

I pulled down the shade and turned to my room,
I was cozy and warm—but alone.
For all of my loved ones, many years before,
Had been called to their Heavenly Home.
As I sat with my memories, a knock at my door
Broke my dreams of happy years, that were few,
As I opened the door, my neighbor's little girl
Said, "Merry Christmas, Mother sent this to you."
And I said in my prayers that night, said I,
"The Spirit of Jesus did not pass me by."

Christian Rural Overseas Program Sponsor Of Food For The Needy

Chicago — A minimum of 23 states will assemble CROP Christmas trains for overseas relief during the week preceding Christmas —with dedications at shipside set for Christmas day at 10 different ports.

That announcement was made here today by John D. Metzler, national chairman of the Christian Rural Overseas program (CROP), sponsor of the trains.

The spectacle of 23 relief trains moving simultaneously across America's rural states—in the largest voluntary effort of its kind ever undertaken—will symbolize the true Christmas spirit in a very tangible way Metzler said.

Between 2000 and 2500 carloads, of grain, beans, meat, dairy products, cotton, rice, and other productes are expected to roll in the CROP food caravan.

Each state has planned one or more dedication services as its train is assembled. Then simultaneous dedications will be held on Christmas day at each of the ports from which relief commodities will be shipped. The exact time of the Christmas dedication ceremonies has not been set, Metzler said.

Goals in half a dozen states range from 200 to 300 cars, with Illinois and Iowa pledged to attain the top figure. Active solicitations for farm commodities were made during Thanksgiving week—when 75,000 volunteer canvassers were expected to go from farm to farm, taking pledges for contributions to be delivered during mid-December.

Nearly half of the total contributions will be wheat. Whole

Second Annual Northeastern District Junior Cattle Show at Rocky Mt. N. C. A Success

Rocky Mount, N. C.—Final reports show that the Second Annual Northeastern District Negro Junior Dairy Cattle Show went over in a big way, surpassing last year's show in every detail, in spite of delay caused by the polio epidemic and the autumn rain fall. A total of 87 animals were entered, nine more than last year's total. The animals were owned by 4-H Club and N. F. A. members of 14 Northeastern North Carolina Counties. Of the 87 exhibited, 16 were registered male and female. The other 71 were good grades, showing traces of good breeding and milking qualities. The attendance was approximately double that of last year and much more enthusiasm was displayed on the part of exhibitors, extension workers, teachers of agriculture and visitors.

The fourteen counties represented by exhibitors and their animals were as follows: Beaufort, four 4-H Club exhibitors, 4 animals. Bertie, four 4-H Club exhibitors, 4 animals: Edgecombe, eleven 4-H Club exhibitors, 12 animals and eight N. F.. A. exhibitors, 9 animals; Franklin, three 4-H Club exhibitors, 3 animals; Gates, nine 4-H Club exhibitors, 10 animals; Halifax, six 4-H Club exribitors, 6 animals and eleven N. F. A. exhibitors, 11 animals; Hertford, five 4-H Club exhibitors, 5 animals; Martin, one 4-H Club exhibitor, 1 animal;

Farm of Future Seen As Marvel of Electricity

Amazing new uses for electric power on the farm are just around the corner, Arthur W. Turner, head of agricultural engineering research for the United States department of agriculture, said yesterday. He spoke at the National Farm Electrification conference in the Congress hotel.

High frequency radiation machines will, find a place on the farm. Turner predicted, because they can be used to pulverize bacteria and fat globules in milk in the same operation. The dairy farmer thus would be able to pasteurize and homogenize his product simultaneously. The same type of machine, he said, could be used to destroy bacteria in eggs before they are marketed.

ELECTRICAL CURING MACHINES

Automatic air conditioning and drying machines powered by electricy also are being developed, Turner said. These may be used for curing a variety of products including hay, corn rice, soybeans, wheat, tobacco, and other crops. Use of such machines would help to save the 10 per cent of the total farm product now lost by poor conditioning and inadequate storage.

L. R. Emmert, director of rural electrification for the Westinghouse Electric corporation, predicted 5,400,000 of the nation's 6 million farms would have electricity by 1957. The total now has passed 4 million whereas in 1927 only 393,000 farms had electric service.

"In 1927 farm residents purchased 860 million kilowatt hours of power representing 1.4 per cent of the nation's total power sales," said Emmert. "This year approximately 9 billion kilowatt hours of power have been sold to farmers, raising their percentage of the nation's total power sales to 4.1 per cent."

A 5.3 BILLION FIELD

Emmert said the nation's power sales are projected at 374 billion kilowatt hours by 1957, with sales to farmers accounting for 21.6 billion. Rural electricity consumption would have increased 2,440 per cent since 1927, while the increase for residential, industrial, and commercial would be only 68 per cent.

These are reasons why the farm market for appliances and electric powered machinery is expected to be a big one in the coming decade, Emmert said. He estimated that farmers would invest 4 billion dollars in home appliances and an additional 1.3 billion in electrical components of farm machinery.

Expert Points Out Facts About Lard and Bacon Hogs

Don't sell your favorite breed of hogs just because they are a so called "lard type" breed, says George E. Strum, assistant livestock agent, NDAC extension service.

If you are satisfied with the breed you have, you can still meet the market requirements by practicing selection of your breeding stock and by marketing at a lighter weight, he says.

The trend toward a lighter weight hog has many formers wondering whether to switch to a different breed. Regardless of type, all hogs develop in growth in the following order:

First their skeleton, then muscle, then fat or lard. By marketing your hogs at about 225 pounds, the proportion of lard is greatly reduced. By practicing selection of trim, long, deep kinds, you can produce market topping hogs that are free from excess fat about the jowl, back and ham.

How long and how well you feed your hogs may determine whether they are lard type or bacon type, Strum points out. Different levels of nutrition have produced both lard and bacon hogs from the same genetic background.

A True Story About a Man

Cap Haynes works like a dog from dawn to dark on his badly eroded 34-acre farm at Liberty Hill, a Negro community in Milam County, Texas. Last year, his best, he netted $1000 and that doesn't include his own time as part of his costs. He ought to be full of complaints, but he isn't. George Sessions Perry says in the current (Oct. 23rd) Saturday Evening Post.

"He doesn't owe a penny to anyone, and pays cash for all his modest purchases," Mr. Perry says. "His children are helpful kids with happy dispositions. Cap Haynes' way of life is as foreign to that of the industrialized Negro workers living in the slums of the great Northern and Eastern cities as any country man's differs from any city man's. . .He comes about as near as anybody I know to leading a happy, busy life. . . "

Mr. Perry's article, "The Haynesses," is the fourth in the "Your Neighbors" series by the Rockland, Texas, author. The purpose of the series is to tell, in neighborly fashion, how the diverse religious and racial groups which make up the American population live today.

Cap Haynes believes that the Negro in the United States is making clear-cut strides toward the full citizenship and full opportunity promised so long ago in the Thirteenth, Fourteenth and Fifteenth Amendments to the Constitution, according to Mr. Perry.

"To Cap, that progress is inescapable," Mr. Perry writes. "His grandfather was a slave; he himself, throughout his boyhood and manhood, has been an overworked, barely literate farm hand. Now Junior, his 10 year old son, has already passed him in education."

Although Cap Haynes and his family - wife, Ressie, their four children, Mary, Pearlie Mae, Viola and Junior, and Cap's widowed mother, Lucinda Goff Haynes - live under primitive conditions, the Haynes' have their self-respect, and the respect of their neighbors, Mr. Perry says. When they go to shop in Rockdale, ten miles from their farm, most of the people treat them with kindness and respect.

"They are known to be good people, have many friends among both Whits and Negroes in town," Mr. Perry declares. "It's true that some wariness is necessary. They must avoid the corners where the drunks and ruffians hang out. . . The cafes are compartmented into white and colored sections. . . The Haynes children must sit in the balcony that is reserved for Negroes at the movies . . . "

Cap lets Bud Gibson, a successful Negro farmer of 72, do the talking, Mr. Perry says.

"With only moderate impatience, since he's a wise old man - but with some actual impatience, since he's a virile one, a pioneer and a Texan - Bud Gibson, unasked, points out that less than 100 years ago virtually all his people were ignorant, illiterate and unfit to exercise the ballot, "Mr. Perry writes. "Like the white peasants driven to the United States from Europe by pogroms and poverty, they were in need primarily of assistance, guidance and education more than anything else. But now he feels that the time has come for the full liberation of his people . . .Bud is certain that the Negro, in his struggle for equal treatment befor the law and in the hearts of men, is traveling with a tail wind behind him. . . "

48,377 Placed in Farm Jobs Within 6 Months

Madison, Wis., Nov. 18 (Special) Wisconsin's 26 employment officers placed 48,377 persons in agricultural jobs in the last six months, according to Harry Lippart, director.

"A paper without editorials is a paper without a soul."--S. C. Bishop, Editor, Crossville, Tenn.

Don't Rail Up Burley in Barn After Stripping

Roy H. Milton

Many Burley growers are stripping their tobacco crop off the rails or tier-poles. Growers of long experience know that such a method is bad, a non-excusable practice. Frequently a fog appears or a long wet spell, accompanied my high temperature; making the tobacco soft as a wrung-out dish rag. Yet, growers keep on stripping.

Tobacco in this condition is too wet to strip. It bruises easily and turns black. When wet tobacco is stripped, growers make a practice of hanging it upon tier rails after it has been stripped, sorted and tied. Stripped tobacco hung up in the barn never looks so pleasing again. It loses its order, therby its luster or sheen. Don't hang Burley tobacco in the barn after stripping.

Nine important steps should be taken before the tobacco is ready to go under the hammer of the auctioneer. These steps were emphasized in the recent grading schools conducted in burley producing counties by federal graders. They are:

(1) Taking down tobacco for stripping, sorting and tying; (2) bulking for holding order and color; (3) using relay method of stripping over a long wide table: (4) sorting the leaves into the grades found on the plants, tying attractive, regulation size (round milk bottle cap) hands; (5) placing each grade, as tied, astride seperate sticks, 14 hands to stick; (6) pressing; (7) packing on the stick into the open coop (hollow center) or pen; (8) packing later into a solid bulk for holding order and making improvement in color and later loading; and (9) last but not least, packing on the warehouse basket, using the round pack method.

Where there is considerable sap in the stalks and the tobacco is still green, it is dangerous to pack more than can be stripped with your crew in two days, as the leaves will become wet, sooner or later get hot and eventually turn black.

HERE AND THERE

Into the hands of the teachers of the public schools of America is committed, as into those of no others, the noble task of training a generation moulded by the priniples of the "Coming Education." If the recognition of the sacred rights of the animal world is clear in the soul of the teacher, if in his or her vision of the things that constitute personal character at its best are these fine and generous impulses of kindness, mercy, thoughtfulness for all that lives with the capacity for pain or pleasure, the children daily feeling the power of such a teachers' life will be fashioned into the same image.

—Dr. Franis H. Rowley.

Gets Casts of Bones of Ape Man Who Lived 1 Million Years Ago

(Chicago Tribune Press Service)

Washington, Nov. 18- The Smithsonian Institution has acquired casts of bones believed to come from a pygmy ape man who lived in South Africa more than 1 million years ago. The fossil was discovered in 1947 in a Transvaal cave and "may have been one of the earliest known of man's ancestors," the institution said.

"It is thought that this creature walked erect, weighed from 80 to 100 pounds had a brain comparable in size to that of the largest known gorillas and showed physical traits closely approaching the human," it added.

Man is the god of the dog; he knows no other; he can understand no other. And see how he worships him, with what reverence he crouches at his feet, with what love he fawns upon him, with what dependence he looks up to him, with what cheerful alacrity he obeys him, his whole soul is wrapt up in his god, all the powers and faculties of his nature are devoted to his service, and these powers and faculties are ennobled by the intercourse.

Divines tell us that it just ought to be so with the Christian—but the dog puts the Christian to shame.

CHOICE WORSHIP SERVICES AND PLAYS

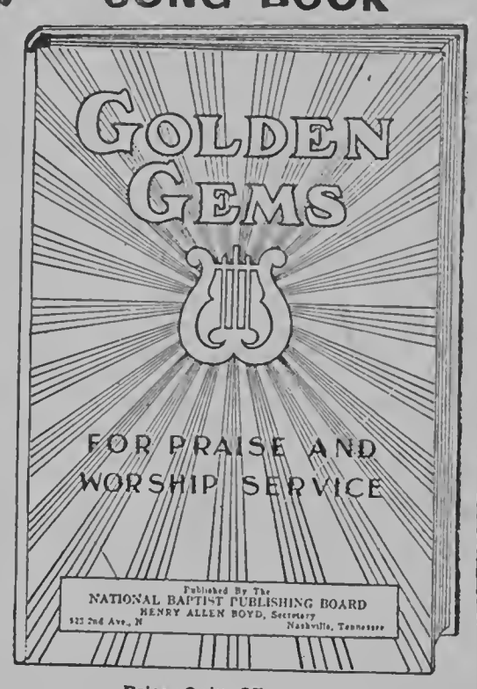
A book that fits in with the urgent needs of the present day. Written by various authors familiar with church requiremcnts. Among its contents are several choralogues: Thc Woman at the Well; Thc Nativity; The Prodigal Son; etc. Tribute to thc Rural Church is a beautiful tableau. The Little Church of Childhood is a plea for the continuance of the rural church. The Melting Pot is a patriotic number climaxing with the church's contribution to the country. Others are for Lord's Day obscrvance and general occasions. A valuable book. 40c.

PLANS AND PROGRAM BOOK

Here is a collection that will provide an abundance of program material to those entrusted with the responsibility of preparing suitable programs for socials, Sunday School entertainment, Young Pcople's Societies, etc. It is a book for many occasions and contains 142 pages

Price 60c per copy

OUR NEWEST AND MOST POPULAR SONG BOOK



Price Only 35c per copy

NATIONAL BAPTIST
HYMNAL
JUST OFF THE PRESS

Responsive Reading

and other valuable information never contained in the book before, are given in this Revised Edition for the use of those who know and apprcciate the best in music. New Songs have been added to the well known and best loved familiar airs and songs. When you need new books for the choir, just think of the Revised National Baptist Hymnal, the best book you could buy anywhere for all occasions.

Farms Run by Tenants Are Fewer

Washington, Nov. 18 (AP)- A smaller number and percentage of farms were operated by tenants in 1945 than at any time since 1890, the census and agricultural economics bureaus reported.

Tenant operated farms numbered 1,858,421 and made up 31.7 per cent of the 5,859,169 in 1945, the bureaus said in a survey of changes in the farm situation between 1890 and 1945.

The report included these observations:

SIZE OF FARMS INCREASED

The average size of farms, 194.8 acres, has increased one-third since 1900. The number of small and large forms has increased since 1940, but the number of intermediate sized farms has "decreased appreciably."

The most common method of renting farms is that of paying a share of the products as rent. It prevails in the areas that produce staple crops. Cash renting is most prevalent in the poorer land areas, in localities near urban centers, and in localities where live stock farming and the production of specialty crops are common."

AVERAGE AGE OF OPERATORS

Tenant farmers, with an average age of 42.8 years, were 8.7 years younger than owners in 1945. The average age of all farm operators, 48.7 years, has increasd 4.2 years in the last 35 years.

Owners who operate their own farms had been doing so an average of 16 years in 1945. The average for tenant operators was 7 ycars.

Two Eye Accidents a Minute; 98 Per Cent Are Preventable

The Workers Who See Best Have Least Injuries, Says Optometrist

Every thirty seconds of the working day an American suffers an eye injury, according to the American Optometric Association.

It is estimated that 98 per cent of all eye accidents could be prevented by adherencc to well-known rules of safety, thus avoiding immeasurable suffering and a monetary loss of some 20 million dollars a year.

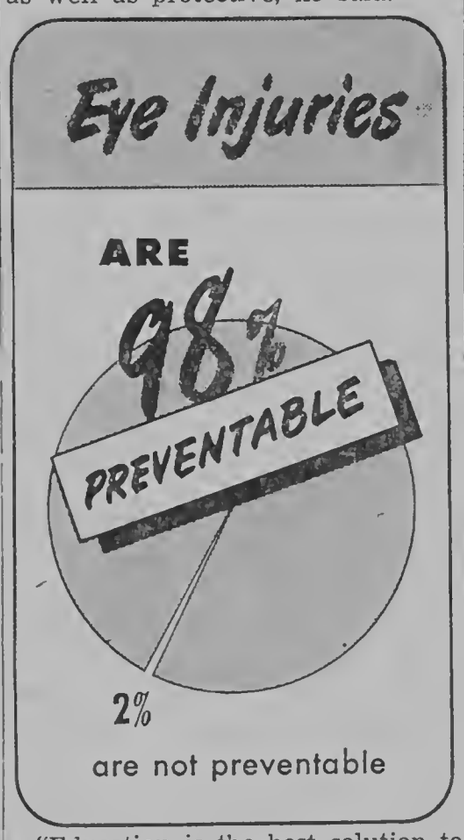
"Eye hazards inrease with intriacte mechanization of industry and the farm and with these of poisonous chemicals and other harmful materials," said Dr. E. H. Westland, chairman of the Association's occupational vision committee. "However, the means of protection keep pace with the dangers, and the accident rate can be kept in hand and greatly lowered by applying the safety measures available.

Dr. Westland said that inefficient vision itself is responsible for one-fourth of all accidents not only to workers themselves but to others. The workers who see clearly and easily have the fewest accidents.

"By proper professional attention to vision, accidents of almost all types can be greatly reduced," Dr. Westland said. "As a result of records on millions of cases, we know the exact visual problems which are most likely to cause accidents in each of the major occupations. Fortunately most of these problems can be corrected either by glasses or by visual training, or by a combination of the two."

Visual training consists of scientific exercises which develop proper coordination of nerves and muscles used in seeing. This work constitutes a part of the practice of optometry.

Dr. Westland said that safety goggles often give the worker a false sense of security against accidents. Unless the gogles lenses are ground to correct the wearer's individual vision problems and unless they are properly and accurately verified and fitted to the individual worker, they may lower his ability to see properly and increase the danger of accident. Therefore safety goggles should be corrective as well as protective, he said.



"Education is the best solution to the accident problem," said Dr. Westland. "The public should be made more aware of the danger of occupational accidents, and more familiar with the corrective measures which science has made avail able"

The Drama of Oil

Some people have wondered why American oil companies have assumed much of the leadership in developing the oil resources of other countries--and just what interest the American citizen has in this work.

The reason isn't hard to find. Oil is a vital instrument of world recovery and world development the success of the Marshall Plan, for instance, is largely dependent on adequate oil supplies. The American oil industry is superbly equipped with the engineering know-how, and all the human and financial resources that are needed to put the oil resources of remote lands to use. And, finally, domestic consumption of oil has reached so high a level, and is expected to go far higher still, that it is obviously necessary to make the rest of the world as nearly self-sufficient in oil as possible.

The largest and most dramatic new development is in the Middle East, where, in time, the Arabian fields will be able to take care of the needs of Europe. Another very important development is underway in New Guinea, where an intense search for crude is being made to serve the growing requiremcnts of the oil-hungry Far East. As one expert puts the problem, "Oilmen are struggling to make every world area more dependent on sources near at home." The world supply-demand balance is delicate, and more oil is the only answer.

America is making staggering contributions to world rehabilitation and progress. And the oil industry has accepted one of the most important roles in this great drama.

Here's How to Cut Food Costs and Still Eat Very Well

Washington, D. C.—Want to hold down your food costs? And still eat well? Still feed the members of your family all the vitamins they need? With plenty of varieity and the best quality? There is one way to do all of this, along with having a steak once-in-a-while. It's done by "selective buying of plentiful foods"

Selective buying means to look for the abundant and low prived vegetable instead of the high priced vegetable. Or grade B eggs instead of grade A especially for cooking. Or poultry and fish, and fruits and vegetables in season. It also means to shop for processed and canned foods which happen to be abundant All these kinds of food are usually more reasonable in price than the foods which are not in plentiful supply.

Each month in U. S. Department of Agriculture says which of the fresh foods are seasonably abundant and which of the processed and canned foods are more than ample to satisfy normal demands. The Department designates these foods in a List of Plentiful Foods.

To qualify for the listing every food must be: (1) In plentiful supply, (2) commonly used by most people, and (3) generally available in retail stores. This list is made available to radio, newspapers and interested organizations in order to inform consumers about plentiful foods.

The Department estimates that the same quantity of food in a basket of plentifuls will cost considerably less than a basket of alternative foods which are not plentiful. And the basket of plentiful foods will match the nutritional value of the other.

The aim of this program is to move into consumption the country's abundant food production. That avoids waste. But at the samc time consumers will stretch their food money by shopping for the plentifuls.

So, watch your buying and look for the "best buys" every week in the plentiful foods at your grocery store.

Fire Prevention Is A Community Matter

Every community in this country, the National Board of Fire Underwriters points out, should have an active fire safety committee, working on a year-round basis.

The committee, if it is to be successful, must have a chairman with energy, enthusiasm, and proved leadership ability. Its membership should be drawn from all elements in the community— churches, hospitals, industrialists and labor unions, service clubs, theatres, veterans' organizations and the rest. And its duties should run the gamut of fire hazards, from ineffective building codes to the existence of fire traps that need to be condemned.

A considerable number of committees of this nature have been formed and are now at work. There is no better way to bring home to the people of any town the danger that fire presents to them—along with easily understood instruction on how to make property safe. Fire prevention, after all, is basically a local matter. Every community has its own special problems. National and state fire safety organizations are doing a splendid and essential job—but they can't individually cover every village. And that's where the local committees enter the picture.

Organized fire prevention work is reaching a peak of activity now, as a result of our record fire waste. More effort and more thought is being given to stopping fire than ever before. And a local fire safety committee in every community, no matter how small its population, is a vital element in the campaign against one of the greatest destroyers of life and property.

Never be afraid that somebody will find out how to do something as well as you do it. If you can do only one thing, you're out of luck

Turning Back the Clock

The main argument against the capitalist, free enterprise, economic system is that it is old-fashioned, has outlived whatever usefulness it may have had, and can't offer the bulk of the people enough benefits to justify its cotinued existence. That seems to be the point of view of all the left-wingers, ranging from pale pink to the deep shades of red and they obviously think it carries a Sunday punch.

However, as Harold Stassen recently said, "Only a great, free productive nation, humanitarian in its impulses, could possibly provide more than eighteen billions of dollars worth of food, clothing, and materials for others since V-J day and yet continue to enjoy the highest standard of living in the entire world."

Every Soviet newspaper constantly harps on the brutal way capitalism treats its workers. Yet there is no other economic system in the world which has so improved the lot of the masses of people, or which has resulted in so wide a distribution of wealth, or which has given practically all of us possessions which would seem like the most unreachable luxuries to the average worker in most other countries. Only under capitalism can a worker quit his job if he pleases and go to work somewhere else. And only under capitalism do millions of people go to work in their own automobiles and, at the end of the week, go home with a paycheck which makes possible our standard of living. In Russia, which claims to be the workers' paradise, you work where the state tells you to. You put in as many hours as the state wants. if you complain, you get shot, or go to prison, or you become a member of a forced-labor gang beyond the Urals. And, unless you're one of the few with high rank in the communist hierarchy, you get paid just enough to keep body and soul together and no more.

The whole western world is looking to this country for its salvation. It is looking to capitalism to produce the goods it must have to live. It is looking to the American worker, the American employer, and the American way of doing things, to save it from civil war, starvation, and another dark age. What country which has succumbed to the paralysis of socialism, communism or any other ism can say one-hundredth as much?

Finally, capitalism is more than a system of economics. It is the way of life which guarantees and protects the freedom of all the people. It is the base which supports representative government. Communism, by contrast, has turned back the clock, and can exist only in an atmosphere of oppression and slavery.

A Two-Way Street

Does the law of supply and demand really control meat prices? Recent events have provided very definite evidence that it does.

During a late four-week period, meat production increased by about one-fourth, as compared with the four-week seasonal low reached in August. During one of these weeks cattle marketings were 35 per cent more numerous than in late August, and hog marketings were more than 50 per cent larger. There was no corresponding increases in demand. The result was a substantual drop in meat prices, running from one per cent to 17 per cent, and averaging about 7 per cent.

This, as one authority on meat marketing said, shows that livestock and meat prices are not a "one-way street." They can and do move two ways--up and down--and the balance between supply and demand determines the direction.

It is true of course, that meat prices, like practically all other prices, are high by prewar standards, and are expected to remain high. Those prices, to quote the marketing authority again, "are neither the choice nor the fault of the producers or the processors of livestock and livestock products."

According to government figures, the average per capita income in this country is at nearly 2 1-2 times the prewar level. "Real income"--that is, income measured in purchasing power--is nearly one-fourth greater. That means that more people with more money are competing for meat. And, on top of that, the operating costs of the farmers who produce meat animals have risen greatly.

Meat moves in a free market--and the consumer gets the best price break possible.

Freeze in Garden Flavor in Moisture-proof Cartons

To keep the most "garden" goodness" in fruits and vegetables that are to be frozen, package them carefully. The point is stressed by Miss Frances O. Van Duyne, assistant professor of foods, University of Illinois college of agriculture.

Choose containers that can be sealed tightly and won't leak. Frozen foods are better when packaged in containers that are moisture-proof and vapor-proof, Miss Van Duyne explains. Otherwise the foods dry out and lose palatability.

Cartons come in a variety of types and shapes. Rectangular or square cartons may have inner linings or have a waxed plastic finish; some are made for use with cellophane bags. Most of these are sealable with heat-by pressing together edges of covering material with an electric iron or a hand iron. The cartons are generally easy to handle and store. Waxed cups are convenient, but the seal on the set-in lid isn't moisture-or vapor proof.

Before sealing a filled carton or bag, wipe inside edges with a clean cloth to remove moisture that would prevent a tight seal. Also press out all possible air from top of bag, then heat-seal tightly. Or you may like the pressure tapes for sealing; they have an adhesive substance on one side so that they can be stuck on edges of bags and cartons.

Economy Plus Efficiency

The high prices of the prescnt may have made many people overlook the ramarkable increase in he efficiency and operating economy of American rctailing that has taken place over a period of years.

Some interesting facts concerning this were produced at the recent annual convention of the National Association of Food Chains For instance, before the advent of the chains the retail gross mark-up on food in the average tore ran from 40 to 50 per cent. Today it is for below that, and in some cases is as small tail gross mark-up on food in the average store ran from 40 to 50 per cent. Today it is far below that, and in some cases is as small as 15 per cent. And that, remember, is gross mark-up, out of which all expenses have to be paid. The net profit of the food chains has been averaging less than one and one-half cents on each dollar's worth of food sold. According to one authority, it is likely that even this tiny profit will be reduced in the future.

Retail progress, of course, has not been confined to food stores or to the chains. Outlets dealing in all kinds of goods--clothing, variety, general merchandise, and so on, have made fine records of better service at a lower profit. And the independent stores, to their credit, have given the chains plenty of tough competition and have held or increased their share of the business.

The store of today, with its fine stock of goods and all its conveniences and attractions, is a far cry from that of a generation back. It required efficiency combined with economy to accomplish this result.

Second Annual Northeastern

(Continued from page 1)

Nash, four N. F. A. exhibitors, 4 animals; Northampton, five 4-H Club exhibitors, 5 animals; Pitt, three 4-H Club exhibitors, 3 animals; 1 N. F. A. animal; Vance, one 4-H Club exhibitor, 1 animal; Wilson, 1 4H Club exhibitor, 1 animal. Three junior exhibitors represented 14 Negro County Agents, in 13 Counties and 9 teachers of vocational agriculture from 6 counties.

Mr. T. H. LeCroy, Farm Relations Officer, of Peoples Bank and Trust Co., was one of the first persons contacted in interest of the first show. He is cooperating with Mr. William E. Bobbitt, Executive Director of the Rocky Mount Chamber of Commerce and a number of other officials and members of the Chamber of Commerce are responsible for the Chamber of Commerce sponsoring the affair each year and for inviting the show back to Rocky Mount next year.

It is not possible, at this time to make mention of all who in one or many ways cooperated in making the show what it was including the banquet which was given in the cafeteria of the Booker T. Washington High School. Outstanding among these, in addition to those already mentioned, are the following: Mr. P. R. Worsley, owner of the stock yards, who has also invited us back next year. In addition to the full use of all facilities of the stock yards, including personnel, cash contribution to the Chamber of Commerce fund, he in cooperation with Bass Brothers, G. C. Redd and Sons furnished rings to go in the nose of bulls and helpers at the stock yard put them in. The A. B. Milling Company of Enfield supplied drinking cups and ice and Allan Mins Co. gave the registered Guernsey bull calf which went as a prize for best showmanship. Too much praise and appreciation cannot be shown Mrs. A. B. Armstrong of Rocky Mount for her untiring efforts in preparing such a fine banquet dinner. We are very g reatly indebted to her for her fine cooperation, the fine meal so nicely served.

Through the efforts of the Chamber of Commerce Executive Director, Mr. W. E. Bobbitt and Mr. T. H. LeCroy and other members of the Chamber of Commerce Agricultural Committee, a total of $700 was raised as follows: Nash and Edgecombe County Boards of County Commissioners, $200 each and the Chamber of Commerce members, $300 given by the following members: Southern Cotton Seed Oil Co.; Planters Cotton Seed Oil Company; Belk-Tyler's Company; Gardner's Dairy Co.; Mr. T. J. Pearsall; Johnson Cotton Co.; City Industrial Bank; Planters National Bank and Trust Co.; Peoples Bank and Trust Company; Southern Dairies; Rocky Mount Hatcheries; S. and W. Redning Co.; Naco Farm Supply Co.; Dillon-Weaver Co.; Lancaster Stock Yards: J. S. Gorham Hardware Co.; Easley's Warehouse; Fenner's Warehouse, Smith's Warehouse, Mangum's Warehouse, China American Tobacco, Nash County Equipment Co.: P. R. Worsley's Stock Yards. Other cash contributions, not through the Chamber of Commerce include, $25 from Wilson County Board of County Commissioners, Rocky Mount Civic Forum, $55 and Edgecombe Co. American Farm Bureau, $75 making a total of $855.

We have had the full cooperation of the local radio stations, the Rocky Mount Evening Telegram, Tarboro Daily and Weekly Southerner and other papers. The Evening Telegram sent its official photographer to the homes of 4-H Club members to get pictures of the members and their calves.

The Negro State Extension officials in Greensboro, Negro Extension workers and Teachers of the Northeastern District, 4-H Club members, N. F. A. members and Negro farmers and friends of the district feel greatly indebted to those persons and organizations mentioned and to the many others who cooperated whose names do not appear here, for their contributions, work and cooperation in making this the biggest Negro Junior Dairy Cattle Show in the State of North Carolina. We also appreciate the invitation to return with the show next year and we hope to come back with more and better animals, better groomed and trained.

F. D. WHARTON,
Edgecombe County Negro County Agent, Chairman of the Committee for the Northeastern Negro Junior Dairy Cattle Show

Mrs. Irene Gross

(Continued from page 1)

speaker emphasized that the twenty-six years of service rendered by Mrs. Gross were a shining light in the pages of the County educational growth and history. He also pointed out that he met Mrs. Gross in the old Whittier school when she was a student at Hampton Institute. Mr. Brooks preceded Mrs. Gross to the County in 1922 and the following Summer he contacted her to teach in the County. She was one of the first teachers hired by Mr. Brooks as Supervisor.

The Parent-Teacher Association sponsors of the banquet prepared a delicious turkey dinner which was beautifully served by the young ladies of the community who were former students of Mrs. Gross. Mrs. Gross was presented with a huge bouquet of flowers from her husband and a silver platter from the Parent-Teachers' Association.

In thanking all who participated in the honors bestowed, Mrs. Gross remarked that she enjoyed a unique distinction of teaching mothers and later teaching their children.

The banquet room was tastefully decorated with Fall leaves, flowers, and pink paper.

Mr. James R. Taylor presided as toast master.

Agriculture School

(Continued from page 1)

development of a School of Agriculture which will and must take its rightful place among the Agricultural Schools of the nation.

This School of Agriculture at Orangeburg is at the crossroad. The State of South Carolina is primarily a rural State. Many of the Negroes of South Carolina are interested in seeking training in farming and is its related sciences and courses, and the College justly feels that adequate facilities and training must be provided for greater usefulness to its students and the people of South Carolina.

For the past three months, the staff of the School of Agriculture has been conscientiously and arduously making an intensive study of the status of the agricultural situation. During the week of September 6, under the guidance of Dr. R. M. Stewart, internationally known educator, aided by Mr. C. M. Hampson, Professor of Farm Management at the University of Florida, Dr. George Hubert Aull, Head of the Department of Agricultural Economics and Rural Sociology of Clemson College, and Mr. J. B. Earle, Soil Conservationist, the staff laid the ground work for long time and immediate development in agriculture at the College. This program, receiving the approbation of the trustees of the College, will be far reaching and effective in extending the influence of State College in making rural life among Negroes more satisfying and profitabe.

Working under the determination to justify the validity and soundness of their proposed plans, arrangements were made for the staff of the School of Agriculture to visit Clemson College, Sept. 28, to observe at the State's magnificent institution, its agricultural plant and to seek counsel and advice from the experts in charge of the practical and technical divisions.

Yesterday, a delegation of experts from Clemson College and the local soil conservationist, serving as consultants, met with the local agricultural staff. The delegation consisted of Dr. G. H. Aull, Head, Department of Agricultural economics, Clemson College, Dr. W. E. A. Husmann, Associate Professor af Agricultural, economics, Clemson College, Dr. J. H. Boyd, Professor of Agricultural Economics, Clemson, and Mr. J. B. Earle, local Soil Conservationist.

The delegation, with the agricultural staff, surveyed the College farms, studied the soil conservation plan designed by the local soil conservationist, and assisted the staff in formulating plans for the execution of the soil conservation, and setting up a sound five year agricultural developmental program at the College.

The importance of agriculture in South Carolina, the need for trained agriculturists other than in the field of teaching, and the breadth of opportunities which exists, call for an expansion at the College beginning as soon as possible. To this and the staff of the College is working.

Horizons are far but heaven is near.
And God's gentle hand shall dry ev'ry tear;
Hard by the night's deepest hue
Lies effulgent down the day to renew.

Earth's vistas marred by raging fires
Shall blossom in peace through God's desires;
For the guns that destroy both far and near
Shall melt to the pen and plowman's shear.—F. O. Criminger, Salter, Mo.

Christian Rural

(Continued from page 1)

wheat will be shipped, since this will provide employment as well as relief, Metzler explained.

States which will assemble CROP Christmas trains are: Alabama, California, Colorado, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Louisiana, Minnesota, Missouri, Nebraska, North Carolina, North Dakota, Ohio, Oregon, South Carolina, South Dakota, Texas, Washington, Wisconsin, and Wyoming.

There is a possibility that contributions may also come from Montana.

CROP food trains have recently gone from the states of Kansas, Ohio, Oklahoma, Texas, and Wisconsin. A number of other states supported trains earlier in the year.

A majority of the states along the Mississippi river will send their commodities to New Orleans, Metzler said. He predicted that the largest train would run from Waterloo, Iowa, to the Southern port, picking up contributions along the way.

A complete list of ports from which commodities will be shipped and at which Christmas day dedications will be held, follows: Philadelphia, Norfolk, Charleston, Savannah, Mobile, New Orleans, Galveston, San Francisco, Portland, and Seattle.

All CROP Christmas trains are sponsored by the Christian Rural Overseas program—which, in turn, is supported by Catholic Rural Life (representing the War Relief Services of the National Catholic Welfare Conference); Church World Service (representing 21 Protestant denominations); and Lutheran World Relief (representing the various Lutheran synods). In every state, all major agricultural organizations are cooperating.

CROP contributions are distributed through church channels overseas, solely on the basis of need, with no regard to race, religions, or political affiliation.

"However, the bulk of CROP goods gets into the hands of children, widows, the aged, and the ill," Metzler said. "It reaches those who have no money to buy and who will receive relief through no other channels."

To date, CROP contributions have been distributed in 43 different nations. Because everything is handled in large bulk shipments, losses have been kept down to four-tenths of one per cent, it was said.

Farmers Increase Their Investment in Credit Co-ops

Washington, D. C. Farmers and farmers' cooperatives increased their investment in the cooperative credit institutions and associations of the Farm Credit Administration $9,893,000 in the year ended June 30, 1948. Total investment of farmers in capital stock of Federal land banks, national farm loan associations, and production credit associations, and of farmers' cooperatives in the 13 banks for cooperatives amounted to $120,487,000 on June 39, according to I. W. Duggan, Governor of the Farm Credit Administration.

"This quickened pace toward farmer-ownership of the entire Farm Credit System is an indication of greatly increased farmer interest in doing business with farmers' credit cooperatives, "Governor Duggan stated. "With the retirement of all Government capital and paid-in surplus of the Federal land banks in June 1947, the goal of farm-ownership of the entire System has come closer. Now with 31 production credit associations entirely farm-owned and 112 others with 75 percent of more of their capital stock farmer-owned, it is easy to visualize the not too distant future when farmers also will own their entire short-term cooperative production credit System."

The largest amount of the farm-owned capital stock of the units of the Farm Credit System was in the Federal land banks and national farm loan association which totalled $56,352,000.

Some 432,000 farmer-members of 503 production credit associations owned $51,492,000 in capital stock on June 30 this year compared with $25,188,000 five years ago. Each farmer-borrower is required to own capital stock equal to 5 percent of the amount of credit he is currently using. However, many farmers have bought additional stock in order to hasten the time when their PCA will attain full farmer-ownership.

The 1,559 farmer cooperatives using the 13 banks for cooperatives owned $12,642,000 in capital stock of these banks at the end of the fiscal year. This was a 50 percent increase from a year ago.

TENTATIVE SCHEDULE OF CROP CHRISTMAS TRAINS

State	State Goal	Approximate date of local dedication	Tentative place of state dedication	Port to which goods will be sent
Alabama	60	December 25	Mobile	Mobile
California	250	December 25	San Francisco	San Francisco
Colorado		December 21	Denver (?)	Galveston
Georgia	69	December 25	Savannah	Savannah
Idaho		December 25	Seattle	Seattle
Illinois	300	December 22	Champaign	New Orleans
Indiana	256	December 22	Indianapolis	Philadelphia
Iowa	300	December 21	Waterloo (?)	New Orleans
Kansas	200	December 21	Wichita	Galveston
Louisiana	55	December 25	New Orleans	New Orleans
Minnesota	200	December 20	Twin Cities	New Orleans
Missouri	200	December 22	St. Louis	New Orleans
Nebraska	100	December 20	Omaha	New Orleans
North Carolina	100	December 25	Norfolk	Norfolk
North Dakota	100	December 18	Fargo	New Orleans
Ohio		December 22	Columbus	Philadelphia
Oregon		December 25	Portland	Portland
South Carolina		December 25	Charleston	Charleston
South Dakota	100	December 20	Sioux Falls	New Orleans
Texas		December 25	Galveston	Galveston
Washington	100	Decembe 25	Seattle	Seattle
Wisconsin		December 20	Madison	Philadelphia
Wyoming	30	December 21	Cheyenne	Portland

Simultaneous dedication of CROP Christmas Trains at Ports on December 25th.

The real proof of courtesy is to have the same ailment the other person is describing and not mention it.—The Gas Flame

If price control is ever accepted in time of peace it will mean the end of economic freedom in the United States.—Senator Taft

Farm Talk with Farm Folk

By Jesse Safley

First and always, farm problems belong to the farmers. Those involved in agriculture have come to realize this more fully in recent years. Evidence of their interest is shown here this week by the some 1,200 farmers, farm women and agriculture leaders attending the annual convention of the Tennessee Farm Bureau.

These representatives from every section of Tennessee are here to discuss and formulate programs that will have a bearing on every farmer in the state—from the largest to the smallest. There isn't any discrimination in the Farm Bureau. It's not an organization for large farmers. It represents all of them in most every phase of farming and farm living.

The Farm Bureau hasn't always had the full confidence of its members. There were former years when it was difficult for the average member to appreciate the things being done for him because they were so intangible. The average farmer found it hard to recognize the efforts of state and national organizations in promoiting and sposoring legislative measures to better conditions for all farm people.

However, that was long ago and farmers now realize that their gains are no longer gifts or normal changes. They know that these benefits come only through the diligent work of the Farm Bureau in cooperation with state and national agricultural agencies. While benefits coming from government action have been on the increase, more tangible benefits also have grown and continue to expand.

The Farm Bureau has made wonderful progress in the past two or three years. It not only has increased its membership by several thousands, but has initiated many valuable organizations which are reaching thousands of farm families in all sections of the state. Among these are (1) the Tennessee Burley Tobacco Growers Association, which plays a major role in the program of every burley grower, (2) the Blue Cross hospitilization program now effective in some 40 counties, and (3) the fire insurance program.

Within a few days, another organization is expected to be added to this list. It's the new automobile insurance company. The announcement may come during the convention. When this new company begins operating, it will affect almost every farmer in the state. There are other programs just as important in the making.

At present, a great deal of interest is being shown in another project — the Tennessee Farmers' Co-operative. It has made much headway in the past few years and has meant a lot to many farmers.

Things have run smooth for the Farm Bureau for some time and it is the desire of all concerned that they continue to do so. However, expanding programs will likely bring growing plans. This will call for closer co-operation. We command the progress that has been made and wish for a most sucessful convention with greater accomplishments in the years to come.

Tennessee farmers have always been short on one thing—adequate storage facilities for grain. Year after year, thousands of farmers continue to produce corn, wheat, barley and other types of grain and store it in cribs that sometimes are unfit to hold shucks.

This is a very expensive procedure. Grain is exposed to weather, rats and other forms of destruction and losses suffered thereby would go a long way toward defraying the construction costs of desirable graineries.

Then too, there are farmers who sell their corn crops from the field regardless of the prevailing price. They maintain that the corn is worth more then than it would be next spring after animals, rats, insects and the weather have taken their toll during the winter months.

In the long run, selling corn from the field is probably the less expensive practice. However, both selling and storing in unfiit cribs are too expensive for the average farmer in Middle Tennessee.

Most farmers want good storage facilities, but the expense of providing such in their opinion is prohibitive. We agree that the cost of a weather and rat proof grainery would be beyond reason if it had to be done every year. However, it turns out to be very small when spread out over a number of years.

Conditions this year are very much in favor of the producer who wants good storage space with little expense.

Corn is selling at a much lower price this year than last. Actual ly, it's bringing about 25 cents less per bushel than the government loan available to those storing the corn.

Using family labor a farmer could do most of the work on the grainery and clear the cost of building it from the money saved by taking a government loan in preference to selling now. Even if he had to employ outside labor, the cost still wouldn't be prohibitive. Grain saved in future years would repay the expense many times.

Main reason for corn selling so low are (1) the crop is large, and (2) there is a shortage of commercial storage space. Corn will no doubt bring a higher price later in the season. In that event, the farmer who has taken a loan can repay it and sell his corn at will. Interest on the goverment loan in only three per cent.

Farmers who pass up this opportunity and go ahead and market their corn are accepting the quickest and by far the most expensive way out. Your local AAA office is in position to inform and work with any farmer on this matter. They have plans available for those who do not have desirable storage and will be glad to assist in any way possible.

We suggest you contact your AAA. office for details before sending that expensive corn crop to the market. You have everything to gain and nothing to lose. Why not take advantage of it?

More Than 250,000 Persons Employed in State Farming

Farming in Tennessee is helping make the state become a great industrial empire.

Simple figures tell the story:

Today more than a quarter of a million persons are employed in industry. In 1943, the peak of wartime production, the total had increased over prewar levels until it reached about 270,000.

And one of the biggest reasons for this factor is demand. The farmers of today are turning toward the mechanized operation of farms. Implement manufacturing plants are accounting—on the large part—for the industrial expansion in Tenessee.

One of the largest plants is in West Tennessee—the $30,000,000 International Harvester plant.

Add to that plant the many others that are making farm tools, equipment and supplies and you'll readily see why Tennessee is expanding industrially.

According to William A. Pitts, Davidson county building commissioner, the needs of the Tennessee farmers are helping to promote the industrial progress of our state.

While emphasis may have been drawn away from agriculture — both in a financial and employment way — it is the land owner who helps keep the industrial plants in operation, J. R. Bess of the Mid-West Appliance Company, Jackson, Tenn., commented.

"Tractors are in great demand today, and the farmers are finding it much easier to modernize their farms than to continue using old fashioned methods." said J. O. Edwards, Savannah, Tenn., implement dealer.

U. S., State Helping Farmers Save Money in Digging Wells

Tennessee farmers and landowners today stand a better chance of striking water when they dig a well than they did several years ago. They now have the help of the state and federal governments.

Geological survey divisions of the state and national conservation departments are presently spending some $180,000 in helping citizens develop water supplies capable of furnishing quantities adequate for farms, small municipalities and industries.

This help, conservation officials have said, has enabled farmers to save thousands of dollars in the digging of wells, because more expensive methods of water supply would probably be impossible.

A $90,000 appropriation was made by the 1947 General Assembly.

Conservation officials said millions of dollars are wasted annually by Tennessee farmers who dig for water without knowing the depth of the water table.

Throughout Tennessee the department is making tests in an effort to locate the lowest point of the water table during dry seasons.

West Tennessee is said to be underlaid by some of the most extensive water-bearing formations in the South-Central portion of the United States.

The ultimate purpose of the investigation is to determine the quantity of water that can be safely pumped without endangering the supply and quality of the water.

Working in the West Tennessee area is Banks Campbell, who has set up an experiment station in Jakson.

Typical examples of the towns in Middle Tennessee which have received help from the Conservation Department are Spring Hill, Franklin, Cornersville and Hendersonville.

Farmers who are uncertain of the water table on their farms should contact the State Geology Division before digging a well.

Total of New Homes Started in October Is Below September

Washington, Nov. 18 (AP) — The number of new homes on which construction started dropped last month from the September total However, the 10 month total for 1948 is well above a year ago.

The department of labor today reported the October figure was only 72,000 compared with 80,000 in September and 94,000 a year ago.

So far this year there have been 803,000 new permanent nonfarm dwelling units started compared with 710,500 a year ago. The 1947 total was 849,000.

A. & I. Music Director Publishes Series Of Music Compositions

Nashville—Dr. Herbert F. Mells, director of music and head of the music department at Tennessee A. and I. College has announced the publication of the first of a series of music compositions since coming to Nashville. The musician assumed his duties at the local institution in September.

The composition is a concertized arrangement of "My Soul's Been Anchored in the Lord" for six voices mixed with solo for soprano or tenor. It is published by Handy Brothers Music Co., Inc., 1650 Broadway, New York City, N Y.

Professor: "This is the third time you've been late. Don't you know you can't stay the flight to time?"

Freshie: "Oh, I don't know. I just stopped a couple of minutes down the street."

How Real Is Christ To You?

We have not an high priest which cannot be touched with the feeling of our infirmities; but was in all points tempted like as we are, yet without sin. Let us therefore come boldly unto the throne of grace, that we may obtain mercy and find grace to help in time of need.—Heb. 4:15, 16.

As you take inventory of your spiritual stock, how real has Christ become to you? Does He seem real to you as a friend, companion or brother? What saith the words of the text?

During the old dispensation, under the law, the high priest would offer up sacrifice for the people of God. He had the high priviledge of standing between God and man. He presented the will of God to man and on the other hand presented the case of man to God. Once a year he would go behind the veil into the Holy of Holies and offer up sacrifice. None but the high priest was permitted to enter this sacred place. There the Ark of the Covenant was kept, the budding rod of Aaron, and the Mercy Seat. When Jesus succumb on the cross, all of this was exposed, the veil which concealed it was rent from top to bottom. No longer was it necessary for the priest to go in and offer up sacrifice but all may come boldly to the throne of grace that they may obtain mercy and find grace to help in time of need.

We have Christ Himself who has gone into the Holy of Holiest and has sat down at the right hand of the Father to make intercession for us and at the same time being God, is able to walk by our side as a companion, friend and brother.

If you ask me to explain how, I cannot, but I do know that to me, Christ is real. I cannot understand all the mysteries of God, they are too wonderful for the finite mind to comprehend. But thanks be to God I am only asked to believe. "Come unto me—and learn of me" says the Master. We shall ever remain students of the divine mystery. I have sailed upon the bosom of great Pacific Ocean and bathed in the troubled waters of the Atlantic. I have felt the chilly breezes of the frigid Great Lakes but even before that from one drop, I could tell what water was. It is not necessary to know all about Christ to know that he is real to my soul. As the blind man registers, "One thing I do know that whereas I was blind now I see."

The Bible tells us that as He moved among men, he subjected himself to the ordinary experiences, save sin. He was tempted in all points. He was once a little child and he understands the thoughts of a child. He was interested in children and said "suffer little children to come unto me and forbid them not for such is the kingdom of heaven." At the age of twelve he was able to talk with doctors and lawyers and yet was subject to his parents. He passed through the age of youth, with all of its thrills and passions yet he remained subject to his parents. He understands the youth today and will be real to them if allowed. As you struggle to prepare yourself for life's career, let Him help you. Allow Him to direct your pathway. Talk with Him frequently and ask for guidance, strength and courage. He understands sympathetically.

He was a friend to all but some he was a specialist. To the blind, lame, lepers, dumb, deaf and lunatic he gave special care. He understands what it means to be poor. He said, "The foxes have holes and the birds have nests but the Son of man hath nowhere to lay his head." He became poor in order to sympathize with the poor. He is real to the poor.

To the grief-stricken he was a man of sorrow and acquainted with grief. In order to show himself a friend to sinners he withstood the criticism of the hypocrits and ate with sinners and publicans.

He hungered, thirsted, grew tired, weary and worn so when we find ourselves under these conditions remember that he understands and will be real to us if only allowed. In all points says the text yet without sin. Let us then come boldly to a throne of grace that we may obtain mercy and find grace to help in a time of need.

ANA Urges State Units To Admit Negro Nurses

Will Appoint A Negro Nurse Assistant Executive Secretary At National ANA Headquarters

New York, N. Y.—A nation-wide drive to extend membership in all units of the American Nurses' Association to qualified Negro nurses has been launched by the ANA Board of Directors, Pearl McIver, president of the organization, announced today.

Miss McIver also announced that the Board has voted to appoint a qualified Negro nurse as Assistant Executive Secretary on the professional staff at ANA headquarters in New York City.

These actions implement the recommendation made at the September 30 conference of the Board of Directors in Kansas City by the Committee on the Structure of National Nursing Organizations.

Following a review of this recommendation, the Board has voted "that a communication be sent to the state nurses' association urging them to give earnest consideration to the question of extending membership to colored nurses in all units of organization of the American Nurses' Association."

For states with dual nurses' organizations, where white groups do not admit Negro members, the Board suggested that a joint committee be established representing both the white and Negro units. This committee is to promote an educational program for creating better understanding of Negro nurse participation in the ANA.

The Negro nurse who will be appointed as Assistant Executive Secretary at ANA headquarters, Miss McIver said, will aid in promoting allw ANA projects and will be especially helpful in encouraging the active participation of Negro nurses in all ANA programs.

"The ANA House of Delegates," Miss McIver said, "pioneered in finding a way to extend membership to Negro nurses in the ANA. Nurses may well be proud of the progress they have made toward opening membership in state nurses' associations to all professional nurses, regardless of race."

The announcement of the drive to extend ANA membership to Negro nurses comes at a time when the ANA is directing the Diamond Jubilee of Nursing, marking the 75th anniversary of the profession in this country. November 14 to 20 has been designated as Nursing Progress Week, and November 16 as Linda Richards Day in honor of America's first professional nurse. The Jubilee is sponsored by Presi. dent Truman, ex-president Hoover and 70 other national leaders.

HERE'S HOPING

Tired little fellow with the weary feet,
Trudging slowly homeward down the busy street,
Bat upon your shoulder, glove held in your hand,
Grime on shirt and sleeve, trousers streaked with sand,
Showing as you walk, from a rearward view,
A tear across the seat, revealing hints of you—
I hope you argue well that in a game of ball
Dirt and tears just can't be helped —they happen, that is all.
But as you turn the door of home,
I trust you will not find
You need to argue to defend the fun you left behind;
I hope you'll find your mother is,
eyes gay with sympathy,
As good a sport as mine was once in years that used to be!

—ARTUR WALLACE PEACH in NEW YORK TIMES.

NEW BOARDER: "This is excellent hash. What's your recipe for making it?"

LANDLADY: "I have no recipe. It just accumulates."

God Rehabilitates Scientist Who Did Not Believe In God

New York—At a meeting one evening, a minister friend of mine, who is a great soul, a rugged personality, a man's man, made the assertion that Almighty God could solve any problem no matter how difficult. The following morning another minister phoned him and said, "I have a woman in my study who heard you speak last night. She says you are wrong, that her problem cannot be solved."

When my friend met this woman, she said, "My husband is a scientist, 33 years old. He committed a bad moral crime and is now in the State penitentiary. Psychologists and others pronounce him hopeless. The judge refuses parole, stating he must serve his full term of 20 years. You said God could solve every problem; let us see Him solve that one."

As God's ambassador, my friend accepted the challenge. He went to the penitentiary where he immediately recognized the prisoner as a former professor, a man of distinction.

The prisoner said, "You have driven a long way to see me, haven't you? That was nice of you, but I have no use for ministers and I have no use for God. You might as well turn around and go back. You cannot do anything for me. All you do is preach theory.

"All right, I will go," my friend said, "but, let me say I did not come out here to enjoy myself. I came to do something for you, but you are so stubborn that you do not want anything done for you. However, I will leave you two Bible texts. Mull them over and I will be back here in two weeks. If you heed these words and believe them, you will be changed."

He gave him a passage from the 1st Chapter of Romans, Verses 28-31, which shows man at his worst; "And even as they did not like to retain God, in their knowledge, God gave them over to a reprobate mind, to do those things which are not convenient; being filled with all unrighteousness, fornication, wickedness, covetousness, maliciousness, full of envy, murder, debate, deceit, malignity, whisperers; backbiters, haters of God, despiteful, proud, boasters, inventors of evil things, disobedient to parents, without understanding, covenant-breakers, without natural affection, implacable, unmerciful."

The man said, "That is me all over."

"All right," said the minister, "That is you at your worst. Now just turn over here in the same book of Romans to the 5th Chapter, and see what it says in the 20th Verse, ' . . . but where sin abounded, grace did much more abound,' and balance the one against the other. You think you are absolutely defeated. Apply those two texts."

A few weeks later my friend went back to the prison and found the man quiet and thoughtful. To make a long story short, today this man whom everyone considered hopeless is the scientist in charge of one of New York ity's greatest industries. He has been out of prison seven years and is again a distinguished personality in the community.

God is the answer. He is your refuge and your strength, an ever present help in trouble. Say that to yourself until your doubting mind begins to believe it and put it up next to your problem, I care nor how difficult it may be. That problem will open as do flowers in the heat and light of the sun. There is no human problem which God cannot solve.

John had been invited to the funeral of his neighbor's third wife, and, as he had attended the funerals of the first two, his wife was surprised when he informed her that he was not going.

"But why are you not going to this one?"

"Well, Mary, it's like this. I feel a bit awkward to be always accepting invitations which I never have anything of the sort to ask him back to."

Intolerance in old age is more often an indication of poor memory than mature wisdom.

THE COLORED

YMCA

Can Accomodate

TRANSIENT MALE PATRONS

When coming to Nashville you are requested to stop at the Colored Y.M.C.A., Fourth Avenue North and Charlotte Avenue.

The rooms are located on 3 floors. Splendid outside rooms with much of the modern conveniences.

It is located in near down town Nashville.
There are clerks on duty twenty-four hours every day.

The rents are reasonable.

If any man wishes to take permanent residence in the building, this can be arranged.

Come to the Colored Y.M.C.A. while in the city.

Nashville 3, Tennessee

Mrs. Mary Bethune Launches Drive To Build NCNW Bigger

Washington, D. C.—We must unite women of all races and creeds into one moral force in the fight for human freedom and civil rights," declares Mrs. Mary McLeod Bethune, president of the National Council of Negro Women, who have launched a drive to get a half million more women in the organization which she heads. The membership campaign will begin on February 2, with a big luncheon in New York City.

Mrs. Bethune says February will be observed throughout the country as National Council of Negro Women and the council's theme will be:

"Unite for Human and Civil Rights."

Mrs. Bethune claims a membership of 850,000 in her organization which was founded December 5, 1935. The council was considered a close affiliate of the New Deal, largely because of the close association Mrs. Bethune had with the Roosevelts, and Mrs. Bethune was a strong supporter of President Truman for president this year. Many members of the council think its name ought to be changed from National Council of Negro Women since Mrs. Bethune seeks to add thousands of white women as members. They point out that a "National Association of White Women" would not be proper for an organization seeking colored women as members.

Another Million Diabetics Sought In Drive, Dec. 6-12

New York—Monday, December 6, was the beginning of a nation-wide drive to find a possible one million persons in the United States who have diabetes and do not know it. A new technique of mass examinations of individuals has been decided upon as the way to find those who are unaware of the fact that they are diabetics. It is a three-minute test in which a few drops of blood are placed on a tablet. The color reaction indicates whether or not there is an abnormal amount of sugar in the individual's blood. If the test is positive the result is sent to the individual's family physician so that he can prescribe for the patient.

Diabetes is a disease that affects young people as well as old, and many a child is a victim, a fact of which the child's parents may be unaware. It is said knowledge of the disease being present in an individual need not unduly alarm the victim. The disease is now being successfully treated, and the only handicap the diabetic suffers over a normal person, physicians hold, is that he or she must give more attention to diet than a person without the disease.

The leading symptoms of diabetes, doctors say, are: increased appetite, increased urinary excretion andl increased thirst.

The drive to search and find the million diabetics who are unaware of having the disease, is being directed by the American Diabetes Association, which has affiliates in all states and cities. The drive will last from December 6 to 12.

According to the tale, the professor in a college in Scotland was giving a demonstration of the properties of various acids.

"Now," he said, "I am going to drop this two shilling piece into this glass of acid. Will it dissolve?"

"No, sir," replied one of the students.

"No?" said the demonstrator. "Then perhaps you will explain to the class why it won't dissolve?"

"Because," came the answer, "if it would, you wouldn't drop it in."

Philosopher: A person who always knows exactly what should be done about anything until it happens to him.

Mrs. Goldie E. Clarke Passes

Wife of Rev. R. J. Clarke of Los Angeles, Calif., Laid To Rest

Los Angeles, Calif.—Mrs. Goldie E. Clarke, the beloved wife of Rev. R. J. Clarke of this city was laid to rest with impressive services recently. Rev. Clarke takes this method to thank his many friends for their kindness during the illness and death of his wife.

Christian Rural Overseas Program Will Send Foodstuffs Abroad

Chicago—Two states, Iowa and Illinois, each have pledged 300 carloads of foodstuffs toward the overseas relief trains now being sponsored by the Christian Rural Overseas program (CROP) all over Rural America.

Seventeen other states have set goals ranging from 30 to 250 cars. Among those shooting for 200 cars or more are California, Indiana, Minnesota and Missouri.

John D. Metzler, national chairman of CROP, with headquarters here, said from 2500 to 3000 cars of farm commodities are expected to be contributed by American Thanksgiving.

farmers between Novcmber 1 and

"During this period there will be about 75,000 volunteer canvassers at work, going from farm to farm, asking for whole grains, live stock, dairy products, and other farm commodities of high food value. Local pastors and county agents are active in the campaigns

Metzler said that thousands of people, including many children, will starve to death this winter unless volunteer aid is forthcoming in large volume.

"We must help those who will not be reached by government aid," he said, "children, widows, the aged, and the ill—those who could not buy food no matter how much government aid increases the basic ration."

American farm folks have already contributed over 50,000,000 pounds of farm commodities thru CROP. These contributions are distributed through church channels in 43 different nations. Distribution is made solely on the basis of need, regardless of race or religious or political affiliations. Because everything is handled in large bulk shipments, losses have been kept down to less than four-tenths of one percent, Metzler said.

Over 30 states will have been organized for the handling of CROP gifts by the end of 1948. Whenever possible, whole grains, grains, and such commodities as raw wool and cotton are shipped overseas—since these commodities furnish employment as well as relief.

CROP is sponsored nationally by Catholic Rural Life, Church World Service, and Lutheran World Relief. All major agricultural organizations are cooperating

A tentative schedule of state CROP campaigns follows. States not completely organized have not been listed.

State	Goal in carloads	Probable commodities	Date of Train
Alabama		Dried fruits, nuts, rice cotton	Nov. 25
California	250	Cotton, pcanuts	Nov. 25
Colorado		Wheat, dry beans	Nov. 11
Georgia		Cotton, peanuts, corn, syrup	Nov. 25
Illinois	300	Small grains, corn, soy beans dairy products, livestock	Dec. 15
Indiana	256	Wheat, soy beans, corn	Dec. 10
Iowa	300	Corn, soy beans, wheat, milk livestock	Dec. 15
Kansas	200	Corn, wheat, livestock	Nov. 25
Louisiana	55	Corn, cotton, beans, syrup	Nov 25
Minnesota	200	Dairy products, grain, livestock	Dec. 20
Missouri	200	Wheat, cotton, soy beans, milk	Nov. 11-15
2servi e		Wheat, livestock Oct. 15	Nov. 15
Montana		Whcat, corn, cattle, horses, beans	Dec. 10
Nebraska	100	Wheat, beans	Oct. 26
No. Dakota	100	Wheat, soy beans, livestock	
Ohio		Grain, dairy products, poultry products, livestock, vegetables	Nov. 25
Oregon			
So. Dakota	100	Wheat, corn, livestock	Dec. 1
Texas		Cotton, livestock, etc	
Washington	100	Wheat	November
Wyoming	30	Beans, wheat, livestock	Nov. 23

A New World Calls For New Ideals

(By H. E. Goodloe)

Roger Bacon once became a very unpopular individual when he prophesied that some day man would ride in a chariot not pulled by horses or other beasts of burden. He further stated that ships would rove the high seas with no rowers to guide or furnish the power. Finally he caused great consternation when he again looked into the future and saw man riding through the air in a machine as though he were a bird. In the age in which this man lived he was considered dangerous. The answere is simply this, "He livcd ahead of his time.

Galileo was the founder of the science of dynamics. Before his time it was believed that a weight a hundred times that of another weight should fall a hundred times faster. Galileo did not believe this and set above to prove it untrue. This same Galileo developed the views of Copernicus concerning the views of the universe. His philosophy was altogether contrary to the views of the religious leaders of the time and he was compelled to recant his views in the presence of the Pope. But time has proved Galileo right.

Indeed the world in which we live is a changing world, therefore we must change to meet the new conditions. Science has chang ed this country from a rural America to a potential urban America. It has changed us from a country interested in merely national problems to a broad America interested in worldproblems. ca interested in world problems. Yes it is now causing men to become more conscious of proper human relations. We are now speaking in glowing terms of the Fatherhood of God and the Brotherhood of man."

SOCIAL IDEALS MUST CHANGE

Do we understand the phrase "The Fatherhood of God and the Brotherhood of man"? We hardly ever turn on our radio or pick up our newspaper but what we hear of something or see something about justice based upon the Fatherhood of God and the Brotherhood of Man. Yet with our fine program of education and with our many fine churches calling for men to be followers of Christ, we are living in a world of hate and greed. Why? Because man knows little about JUSTICE. He still is unwilling to treat his fellowman as he would like to be treated. He thinks in terms of living not according to his needs but his greed. The result is discontent, fear, and hate. Why is there now raging heated misunderstandinys between capital and and labor? Why the international rivalry between nations? Why are we now fighting a WAR OF NERVES that may soon lead to a third World War? Simply this: "Man is thinking in terms of Greed and Greed breeds misunderstandings, hate, and fear. The new world is calling for changed ideals. WE NEED A NEW TYPE OF LEADERSHIP..

Last year I was teaching a class in Sociology and I asked this question, "How many of you like white people? Out of a class of thirty-five, not one said that they liked white people. Why should such a condition exist in this great democracy? As a teacher, I somehow did not concern myself with the cause. What struck me was, that such a condition should not exist, and it was my job to remedy same. I began to discuss with the group concerning the interdependence of one group to the othcr. That is Negroes and whites I then asked, "How many worked in white homes? Next, I asked, "Did they like their jobs?" A majority did. In short, they depended upon their employers for their employers for their living and the employers depended upon them for a certain service, and to that end there should be mutual understanding and respect, neither of which breeds hate. At the conclusion of the class period, those boys and girls left the room with a different point-of-view.

Today we have a white teacher to come to our school each week to teach Bible. She is honcst, sincere and a fine example of a Christian. The contacts made by both much to create good will among the people of our city. If the problem of prejudice is to vanish, it must come about by our leaders who are interested in better human relations, who are willing to throw aside prejudices and preconceived notions that have existed in the past and experiment for truth. Leaders in the field of human relations are suffering in many instances as did Bacon and Galileo; but I say unto you that "Truth crushed to earth will rise again."

New Y. M. C. A. Entrances

Improvement Being Made On Property At 4th and Charlotte

The entrance to the Colored Young Men's Christian Association will now be made on Charlotte Avenue, formerly known as Cedar Street. The contractors who were awarded the work of remodeling the building and the bank quarters are progressing nicely with their work. The new entrance, which is where the Kennedy Taxi-Cab Company had their offices for twenty-five years or more, is plainly seen and easily found, because there is a circular neon sign over the door which says "Colored Young Men's Christian Association Entrance." It is in thrce colors. Effective this week therefore, all the entrances and exits for the upstairs portion of the Colored "Y" will be from Charlotte Avenue or Cedar Street side. There will be no more passing through the bank quarters to get to the Colored Y. M. C. A., which occupies these floors above.

The chairman of the Colored "Y," Rev. S. H. Simpson, and the Business Secretary, Mr. M. J. Davie, made this announcement early this week, and urged that the patrons of the "Y" use the Charlotte Avenue entrance until the Fourth Avenue improvements could be completed. The contractors were to begin work of that this week. When the Fourth Avenue entrance is finally finished there will be a neon sign over it, so that there will be an entrance from both the Fourth Avenue and Cedar Street, with exits at the same places.

When this work is completed, the president of the bank, Rev. Herny A. Boyd, said work would then begin on the interior improvements of the bank quarters which occupy the ground floor of this four-story building located at Fourth Avenue and Cedar Street, or Charlotte Avenue. The bank and the "Y" officials authorized this construction and these improvements several months ago.

Television Causes Upheaval; Performers Got To Be Actors

Los Angeles, Calif.— (G) —The actor who can learn his part quickly and surely is the one who will survive "the latest and greatest change of all" in the history of his profession—television.

This is thc prophecy of Norman Randolph Field, lecturer for a course in television acting which the University of California recently added to its curriculum.

"Television acting is different from all other acting which has preceded it — in technique it is made up partly from radio, partly from motion pictures, but most of all from the art of the original 'legitimate' stage. Motion picture actors and, more especially, radio actors who could rely on the constant aid of the always present script must face the television camera with no such bolstering. Memory is back, photogenic faces and figures are back, and youth is still at a premium—but acting is back too. Stage directions, lights (hotter than they were in musical comedy) costumes and scenery are back: make-up is back, and relic of exactly fifty years ago, the quick-change is back," points out Field.

"The actor who can act with his face of course but also with his hands, his feet, his body and his voice—the actor who can learn lines quickly and surely, is the one who will survive this last and greatest change of all."

His Word

By Archbishop W. D. C. Johnson

The parable of the Ten Virgins, St. Matthew 14 and of the talents, 31, also the discription of the last judgment is our text.

Then shall the Kingdom of Heaven be likened unto ten virgins which took their lamps and went forth to meet the bridegroom. And five of them were wise and five were foolish. They that were foolish took their lamps and took no oil with them: but the wise took oil in their vessels with their lamps. While the bridegroom tarried they all slumbered and slept and at midnight there was a cry made. BEHOLD THE BRIDEGROOM COMETH. GO YE OUT TO MEET HIM. Then all those virgins arose and trimmed their lamps and the foolish said unto the wise, Give us some of your oil for our lamps are gone out. But the wise answered, saying, Not so lest there be not enough for us and you. But go ye rather to them that sell, and buy for yourselves. And while they went to buy the bridegroom came and they that were ready went in with him to the marriage and the door was shut. Glory be to the Father and to the Son and to the Holy Ghost, as it was in the beginning, is now and ever shall be, world without end in the name of the Father, the Son and the Holy Ghost. Amen.

Teaching Geography With Stamps Urged By A. & I. Professor

The wealth of teaching material made available to geography teachers through the use of postage stamps was pointed out by James K. Anthony, instructor in Geography, Tennessee A. and I. State College, in his scholarly article currently appearing in the November issue of The Journal of Geography.

Anthony, who is beginning his second year at the college, holds a Master's Degree from Ohio State University. He formerly taught at Southern Uunversity, Baton Rouge, La.

His article "Postage Stamps as Visual Aid Material in the Teaching of Geography" gives a host of illustrations of stamp series that can be effectively used for instructional purposes. He notes that the Lindberg airmail stamp of 1927 not only shows a picture of the famous "Spirit of St. Louis" but in the background the northeastern coast of North America and northwestern coast of Europe are shown on the dotted line indicating Lindbergh's route from New York to Paris. Similarly plans for a unit on mountains can be found in the National Parks issue of 1934.

According to Anthony one of the finest sets of stamps picturing geographical exploration is the Spanish issue commemorating the voyage of Columbus to the New World. Outstanding features of this set are the stamps showing the **Nina, Pinta,** and **Santa Maria.**

Two Tennesseans Promoted By Army In Yokohoma, Japan

Yokohama, Japan— PFC Simon P. Teasley of the 611th Transportation Port Company, son of Mrs. Theodia Teasley of 914 12th Ave., Nashville, has been found qualified in the military occupational specialties of the utilities man and duty N. C. O. acquired largely through his army training and experience.

Teasley entered the army in 1946 and arrived in this theater the same year.

Pvt. Willie E. Boyd, husband of Mrs. Dorothy Boyd of 218 Turley Street, Memphis, has qualified as a specialists of riflemen and heavy artillery gun crewman. He also is a member of the 611th Transportation Port Co., and entered the army in 1947.

Tennessee Second In Deaths Recorded By Tuberculosis

In 1946, more than 50,000 persons in the United States died from tuberculosis, one for every ten minutes. Tennessee ranked second from the top among the states in the number of residential deaths responsible for this staggering total of unnecessary deaths.

It is against this somber health background that the current Christmas Seal Sale to raise funds for fighting TB is being carried on, sponsors of the sale point out.

More than half of the victims of TB in Tennessee are unknown to medical or health authorities, and, for the most part, most of the sufferer themselves do not suspect that they have the disease. These unknown suffers are a constant danger to the welfare of their families and communities. Wherever they go, they threaten to spread the malady.

These people must be found by mass check x-ray or other means and treated while cure is still possible. All of the citizens through various educational means must be indoctrinate dagainst TB, for until the whole population is thoroughly alert, the finest hospitals and the most advanced medical treatment cannot defeat TB. Finally help and direction must be given victims and their families.

Christmas Seals have financed a varied program of education, relief, and rehabilitation which over the years has twice cut the TB death rate in half. A stepped-up drive can eliminate the disease entirely in this present generation. Any relaxation at all will enable TB to state a dangerous upsurge. With the goal of total elimination in sight, local TB association officials are calling on all citizens to increase their purchase of Christ mas Seals this year.

Ideals are like stars—we never reach them, but we like mariners on the sea, we chart our course by them.

Educational Institutions Whose Programs Are Geared To Give Instructions to Old and Young

Land Grant Colleges and Associate Land Grant Colleges, with the States and Towns In Which They Are Located, Correct Names and Addresses of Their Presidents to Whom Readers of the Modern Farmer May Write

Twenty-four schools whose curriculum has been accepted by State Boards of Education, in which the youth can major in subjects that he likes best, and where he can pursue such study courses which when he has finished will help him in his life's work. These institutions challenge the admiration of the educated people of today. They are Land Grant Colleges and Associate Land Grant Colleges. While they do specialize in agriculture, home economics, dairying, farming, cattle raising, poultry raising, truck gardening and other pursuits of industry and agriculture, they are doing this because there is need for them. There is no race, no creed or color in vegetables, poultry, butter, eggs, beef, pork, beans, potatoes; in fact, what the world subsists upon, nobody asks—who raised it? So therein, lies the solving of much of our high cost of living.

The Modern Farmer therefore, invites the readers to write a letter to each or all of these colleges and ask them to send you their Catalogue so that you can read, study and make your own decision from the following schools:—

LAND GRANT COLLEGES AND PRESIDENTS

Alabama (Normal) A & M Institute; President J. F. Drake
Arkansas (Pine Bluff) State College; President L. A. Davis
Delaware (Dover) State College; President H. D. Gregg
Florida (Tallahassee) A & M College; President W. H. Gray, Junior
Georgia (Savannah) State College; President James A. Colston
Kentucky (Frankfort) State College; President R. B. Atwood
Louisiana (Scotlandville) Southern University; President F. C. Clark
Maryland (Princess Anne) Princess Anne College; President J. T. Williams
Mississippi (Alcorn) A & M College; President W. H. Pipes
Missouri (Jefferson City) Lincoln University; President S. D. Scruggs
North Carolina (Greensboro) A & T State College; President F. D. Bluford
Oklahoma (Langston) Langston University; President G. L. Harrison
South Carolina (Orangeburg) State College; President M. F. Whittaker
Tennessee (Nashville) A & I State College; President W. S. Davis
Texas (Prairie View) Prairie View State University; President E. D. Evans
Virginia (Petersburg) State College; President L. H. Foster
West Virginia (Institute) State College; President J. W. Davis

ASSOCIATE LAND GRANT COLLEGES AND PRESIDENTS

Alabama (Tuskegee) Tuskegee Institute; President F. D. Patterson
Atlanta (Atlanta) University; President R. E. Clement
D. C. (Washington) Howard University; President M. W. Johnson
Georgia (Fort Valley) State College; President C. V. Troup
New Jersey (Bordentown) Manual Training School; President W. R. Vallentine
Ohio (Wilberforce) Wilberforce University; President C. W. Wesley
Virginia (Hampton) Hampton Institute; Dean S. J. Wright (no President at the present time)

Banner To Remain In Tennessee

Delegation From Volunteer State Making Great Plans

Whether the Sunday school forces of Tennessee will be able to retain the National Prize Banner which they won in the contest at the Sunday School Congress in Kansas City, Mo., last June, is going to depend entirely upon how Tennessee and its Sunday school, BYPU, and other religious forces respond to the call that has just been issued following the adjournment of the Baptist State Convention that was held at the Ebenezer Baptist Church last month. This National Banner is given out each year when the Congress meets. It is awarded to the state that has been able to lead other states in work done through the year, attendance reported according to population and church enrollment, conferences during the year, representation sent to the annual meeting and cash reported on Sunday morning during the Model Sunday School hour. There is always a spirited contest carried on the entire week of the Congress by the various state delegations.

When the leaders here made the announcement that they propose to retain this banner, the leaders of Illinois, Mississippi, Texas, Louisiana, Arkansas and others accepted the challenge, and coming up to Nashville from these sections is the word that if Tennessee holds it they must more than double their report that was made in Kansas City, hence the Volunteer State is organized, they have set their campaign in motion, decided on the goal that they must reach, and are now saying to the other states: "We will see whether we, meaning Tennessee, will keep this National Award for another year."

It was the first time in forty-four years that Tennessee had taken a National or Prize Banner, although the Congress was set up here in Nashville by the late R. H. Boyd, secretary of the Publishing Board, when the session was held at Spruce Street Baptist Church. The late Dr. C. H. Clark was presiding over the session at that time. Since then they have held sessions from as far west as Denver, east to Columbia, S. C., south to New Orleans, La., and north to Chicago, Ill., and Cleveland, Ohio. On each Sunday morning the powerful organization forces of other states has eased Tennessee out of first position.

Rev. Mr. Patton, who led the campaign last year, has already contacted the new president of the State Convention, Rev. J. O. Clark, and the president of the Sunday School Group as well as the Sunday school and BYPU superintendents and presidents organization in Nashville, and they have promised him that if the banner goes away from Tennessee it will not be without a terrible struggle, as they intend to hold it here at headquarters of the Baptists of the nation.

Dr. William Hicks At General Headquarters

Shreveport, La. -(Special)- International Missionary William Hicks B. D., returned to his general Missionary Headquarters, 1948 Weinstock Street, Shreveport, La., and is full of praise to God for enabling him to complete his third Missionary journey over the face of America and into parts of Canada, as far as Winnipeg.

He reports greetings to his twenty-two churches successfully pastored through the past fifty years, not including a part of two years of successful missionary work in Los Angeles, Oakland and San Francisco, Calif. Rev. Hicks says he gives the praise to God.

A new recruit was being inducted and the officer asked him if he was interested in a commission. "No, thanks," he replied, "I'm not too good a shot. I'd rather work on straight salary."

—Great Lakes Bulletin

Irresistable Forces

In the November issue of the American Mercury, F. W. ImMasche, an official of the Department of Agriculture's Production and Marketing Administration, writes on "The Truth About the Meat Situation." His facts and conclusions deserve consideration by the consumers of the country.

Mr. ImMasche traces the remarkable advances in employment and wages, and shows their inevitable influence on the price of meat and all other commodities in high demand. He points out that time is the big factor in increasing the meat supply, even when market and feed conditions are favorable--it takes three years to produce a beef animal, and about a year for pork and lamb--and says: "So far it has not been possible to increase meat production as rapidly as wage increases have been coming. Consequently, the higher wages and salaries have resulted in further advances in meat prices and the cost of living."

The outlook now is for a substantial increase in the meat supply in the relatively near future. It remains to be seen what the long-term trend of prices will be. And here is where Mr. ImMasche's concluding words are significant. "In figuring what we are going to pay for meat," he says, we should not overlook the fact that our entire economy is becoming established at a different and higher level of wages and salaries, prices and costs, than before the war. We may as well recognize that the day of going to the butcher shop for a quarter's worth of pork chops for the famliy has gone the way of the "good five-cent cigar."

The economic forces of the day will determine meat prices--and all other prices. We cannot have peak wages and earnings and "cheap living" at the same time.

THE JERICHO ROAD
By REV. J. O. CLARK

And Jesus entered and passed through Jericho. Luke 19:1

I would like to direct your attention in a series of sermons to four roads of the New Testament times: These roads are the Jericho Road, Jerusalem Road, Emmaus Road and the Demascus Road. Jesus travelled these roads while upon earth, moving among men.

For this thought I am indebted to two our Primary Department teachers. Mrs. Corin Dickerson and Mrs. Maude Johnson. These teachers, with their children presented a pagent, displaying the happenings along these roads.

In the particular discourse, I would have you consider the Jericho Road.

Jericho, a royal city of great antiquity has stood out very prominently in the affairs of the people of God. It is located about sixteen miles northeast of Jerusalem. It was this city which Joshua marched around seven times and the walls fell down. It was rebuilt by king Hell about 925 B. C.

The Jericho road between Jerusalem was much traveled. The first incident for our discussion is the experience of Zacheus.

Zacheus was a chief among the publicans, and was rich. He desired to see Jesus, after hearing that he was coming down the Jericho Road. Being small of stature, his view was hindered by the great crowd gathered along the road to see Jesus.

He was determined to see Jesus He ran ahead of the procession and climbed a Sycamore tree and waited with anxiety to see Jesus as He passed.

If there is a sinner here this morning desiring to see Jesus, he must lift himself above the crowd. As long as you look merely on the crowd about you, your right view of Jesus of His church will be hampered.

If you will make an effort to see Jesus He will surely reward your effort with success. Zacheus wanted to see Jesus—Jesus wanted to see Zacheus.

For that purpose Jesus had chosen to walk the Jericho Road.

Jesus looked up said to Zacheus "Make haste and come down, for I must abide in thy house." Jesus will not only see those who would see Him but He will abide in their house. Behold I stand at the door and knock and if any man will open the door I will come in unto him and will sup with him and him with me."

Zacheus made hast and came down and in the present of Jesus felt and acknowledged his guilt.

"Behold Lord half of my goods I give to the poor, and if I have taken anything from any man by false accusation, I restore him fourfold.

It yas indeed a great day for Zacheus, salvation had come to his house. Jesus said, "The Son of Man is come to seek and to save that which was lost." He is in the Jericho Road today to lend a helping hand to you and to me.

Along the same road as they journeyed, a blind man heard the footsteps of the procession and inquired about the noise.

Somebody said to him, "Jesus of Nazereth is passing by." He lifted up his voice and cried "Thou Son of David have mercy on me."

They tried to tell him that Jesus was too busy, that He was in a hurry. But the more he cried "have mercy on me."

Jesus is never too busy to hear the cries of those who need Him most. "Bring him to me" was Jesus' command.

He bids us bring our burdens to Him today as we Journey along the Jericho Road of Life.

I connot see Him with natural eyes but I know as I travel along the Jericho Road with my burdens He will hear my cries, lift my burden, for He is ever near.

If you are here this morning with your burdens of life, bring them to Jesus. His invitation is extended. "Come unto me all ye that labour and are heavily laden and I will give you rest. Take MY Yoke upon you and learn of me, for my Yoke is easy and my burden is light and ye shall find rest unto your soul.

The blind man's burden was blindness Jesus saith unto him what wilt thou that I shall do unto thee? "Lord that I may receive my sight." Jesus said "Receive thy sight, thy faith hath saved thee."

None along the Jericho Road were ever disappointed who called on Jesus.

Bible Sustains Shipwrecked Men

The captain of an American four-master schooner that was wrecked and the crew of which had an eight-day fight for their lives with gales, in open boats, says: "Four men had Bibles, and read aloud while waiting for their turn at bailing out the boat. During all these trying days it was their hope for safety from the great God who rules the waves that kept them courageous and determined not to give up."

BIBLE LIGHT
(Ps. 119:9-16.)

V. 9. "Cleanses his way." The Bible is the great purifier. It not only points out sin, it points out the salvation from sin.

V. 9. "By taking heed." The Bible does no good unless we think it over. Heedful reading is the only helpful reading.

V. 10. "With my whole heart." If our Bible-reading is half-harted, it will not influence our lives.

V. 10. "I sought thee." The Bible is a door through which we go to meet God.

V. 10. "Let me not wander from thy commandments." The Bible is a beautiful path, leading to the heavenly city; but we must walk in the path, or we shall not reach the end of it.

V. 11. "Hid in mine heart." We "learn the Bible by heart" when we commit to memory Bible verses. They are stored up for any time of need.

V. 12. "Teach me thy statutes." Every Christian may be a Sunday-school class of one, with Christ as the Teacher.

V. 14. "I have rejoiced as much over a newly discovered Bible truth as over an increase in salary of a present of money.

V. 15. "Meditate in thy precepts." It is an excellent plan to commit to memory a great verse of the Bible every morning and think about it at odd minutes all through the day, thus making it our own.

V. 16. "I will not forget thy word." No one can master his Bible-or anything else--without frequent reviews. The Babel of life is constantly trying to drive it from our minds.

Twenty-three A. and I. Students With Instructor Saw N. B. P. Board Plant

Twenty-three students led by their instructor from A. and I. State College, visited the National Baptist Publishing Board's plant on Wednesday of this week. Notice about their coming had been sent to Secretary Boyd by Dr. George W. Gore, Jr., the dean of the college and instructor. Three annual pilgrimages to the Publishing, Printing and Manufacturing plant of the National Baptist Convention of America are arranged by Dr. Gore in order to give the student-body first-hand information on the fundamentals of the art preservative, which must be understood by members of the fourth estate if they are to succeed in their life's work or make a success out of what they major in in college.

In the group of students there were those from Mississippi, Florida, New Jersey, Alabama, Illinois, Indiana, Arkansas, Pennsylvania, Maryland and Tennessee. The delegation was divided nearly in half, and a guide took each of them systematically through the six buildings and the various departments, explaining to each of them what went on in that particular department. Secretary Henry A. Boyd greeted them on their arrival at the plant, 523 Second Ave., N., shook hands with them individually, as Dr. Gore stood by and called their names, simply saying: "I want you to shake hands with this friend of mine who likes to be called Henry Allen Boyd. He is the secretary of this institution, and is a well known Sunday school worker. He is also president of the Citizens Savings Bank and Trust Company, and I always refer to him as my personal friend."

I Take Jesus

A Symposium of Personal Testimony of Surrender to Christ

"I was brought up in a Christian home and had the benefit of services of church and Sunday school through my early boyhood. At the age of thirteen, it was my good fortune to have a very fine teacher in Sunday school. She was a woman of splendid character, daughter of a substantial landowner, wife of the town blacksmith, and mother of one of my playmates.

"Our class had no room and practically no material . equipment. We met over in thecorner behind the little organ. Our teacher sat on the organ stool and literally radiated her primary qualifications: she knew the Lord and she loved her boys. One night after the evening service as I was going through the vestibule of our fram church building, my little teacher put her arm around my shoulder and said, 'John, I'd love to see you a Christian.' Not many days after she saw John a Christian. That's all anyone ever did to win me to Christ, and I am unspeakably grateful for this service which any teacher or leader who knows the Lord and loves people can render."

John L. Hill

"I was born in the flesh on April 27, 1892. I was reborn—born again, to employ the exact words of Jesus—on July 19, 1902. The first birth was physical; the second birth was spiritual. I became a human being in the first birth; I became a spiritual being in the second birth, regenerated by the Spirit of the Living God, reconciled unto him through faith in the Lord Jesus Christ, having been convicted of the guilt of sin by the Holy Spirit. In my consecious guilt before a just and holy God, I repented of my sins. 'By grace are ye saved, through faith, and that not of yourselves, it is the gift of God.'

"Blessed to have been born the first time of God-fearing parents, I was reared and nurtured in the admonition of the Lord—the family altar, Sunday school, attendance unpon worship in the meeting house from my early infancy, the daily example of Christian discipleship on the part of my father and mother.

"On the nineteenth day of July, 1902, between sunset and dark, I reached the moment when I stood condemned before God. I was the most miserable ten-year-old boy in the world. Something had to give—either I would reject or accept the proffered love of God in Jesus Christ.

"I went into the orchard near the syrup shelter. I fell on my knees under an apple tree, locking my arms around the trunk of the tree. I cried out in agony of soul, 'Lord have mercy on me and forgive my sins, for Christ's sake.' The darkening horizon was aglow with the light never on land or sea. I ran into the kitchen where my mother was cooking supper. She threw her arms about me, weeping in the ecstasy of answered prayer, and said, 'Thank God, my boy is saved.' I ran to the front porch where my father sat entertaining the visiting preachers. He drew me to his breast in the twilight and said, 'My boy has been saved. Thank God, thank God.'

"And now, for forty-six years, I have walked in the peace and truth of God's will and way for all who humbly and sincerely seek salvation in him."

Louie D. Newton

Going Too Far

The public should understand the excessive demands being made by 16 non-operating raildoad unions, representing 1,000,000 railroad employes.

These unions request a 25 cent an hour wage increase. In addition to that, they wish 48 hours pay for 40 hours work, which would amount to about 23 cents an hour more. Most remarkable of all, they are demanding time and one-half, with a minimum of 12 hours pay for any hours worked on Saturday, and double time, with a minimum of 16 hours pay for any hours worked on Sunday and holidays.

The unreasonableness of this last proposal is especially evident. The railroads are not like a manufacturing business, which can work a certain number of hours and days each week and shut up shop the rest of the time. Their service must go on every hour in the day and every day in the year. To heavily penalize them for week-end operations could lead only to a decline in their standards of service.

It is estimated that the demands of these unions, if granted, would cost some $1,500,000,000 a year. A precedent would be set which all unions, in addition to railroad unions, would seek to follow. And all of this, it must be remembered, comes at a time when railroad revenues, in spite of heavy traffic, are too low to permit anything near a fair return on the investment--and when it is essential that the lines expand and improve their facilities at today's heavy costs.

Railray labor is well paid. It has been granted many valuable concessions. Demands such as it is now making can only weaken and disrupt one of the country's best and largest employers, imperil the transportation progress this expanding country must have, and disgust the public with a new method of picking its pocket.

Every Christian An Evangelist

Ours is a day of tremendous propagation and evangelism. Messiahs, true and false, are abroad, and we had better not sit back complacently, saying that God's side will win out in the long run. For where there is no vision, the people perish! I commend the common-sense realism of the young Anglican clergyman who, along with others, was invited by the presiding bishop of his communion to attend a quiet retreat. He replied as follows: "What my church needs is not a quiet time, but an earthquake!"

It is only as every Christian again becomes an evangelist that the contemporary church will retrieve the majestic and militant stature of the New Testament church. Turn the pages of the Acts of the Apostles, and you contact men who went up and down the world of their time saying, "We cannot but speak the things which we have seen and heard." Pray, what things? Why, men formerly dead in their sins and trespasses, or infested with disease, restored to wholeness through the touch of Christ; entire towns and cities shaken by the revolutionary power of the gospel.

What needs to be said is that miracles of healing and redemption and awakening of a like nature should be occurring in the modern church. They will happen again when we are ready for them. Said the prophet Isaiah, "Behold, the Lord's hand is not shortened, that it cannot save . . . but your iniquities have separated between you and your God" (Isaiah 59:1- 2). And a great Christian worker has given his opinion that "not miracles, but great faith has ceased." What we in America need to realize is that the spiritual awakening so much needed among us will not come through a merely routine Christianity; by merely formal preaching, worship, praying. Neither will the kingdom of Christ come by means of impressive but deceptive yearbook statistics! Here, for instance, is a church boasting a membership of 2,500, but with an average attendance at worship f 400. Here is still another church with a membership of 1,200, with an average attendance of 250 listed. We need a modern Ezekiel to descend into the valley of our sterile Christendom and to pray the prayer, "O ye dry bones, hear the word of the Lord . . . Behold, I will cause breath (the Spirit) to enter into you, and ye shall live" (Ezekiel 37:4, 5). No, not even to go to church regularly, or to listen to sedate and impressive sermons will suffice. What puts a growing edge on a church, and keeps it there, is something else! It is when every Christian and church member becomes an evangelist, a bringer of others to Christ.

The Fervent Heart

There is a new awareness of the need of the fervent heart in Christian work. The ultimatum which the times hurls at us is simple, evangelize or perish. In its crusade for Christ, the Methodist Church exceeded its goal of 1,000,000 new members. The Presbyterian Church, U. S. A., has set a goal of 1,000,000 in three years; the Disciples of Christ. 900,000 in three years. the Congaregational Christian churches, 240,000 in three years; and the Evangelical United Brethren, 300,000 in four years. The Roman Catholic Church is waging one of the greatest evangelistic campaigns in its long history and is coming down into our Southland with trucks laden with religious literature. Its "propaganda" abounds on the streets of our leading cities. It believes in evangelism. The various anl many peripheral sects are using our comparatively lukewarm and complacent churches as a appy hunting ground for new converts. One sometimes sees more honest-to-goodness, down-to-earth evangelism in service clubs than in the churches.

Nothing so tones up the element of personal experience and retrieves the growing edge in a man's soul as for him to give himself away in warm, friendly, Christian witness. Has your spirit lost its initial zeal and grown flabby? Then, go out and win another person to Christ, and your own feet shall be planted 'on higher ground." Then the meaning of the Lord's command shall dawn on you with new significance: 'Ye shall be witnesses unto me . . . unto the uttermost part of the earth" (Acts 1:8).

Somehow, we must dispel the rank heresy that Christian preaching and witness are the task of certain professional men we call "ministers" and whom we engage to do it for us. When Christian laymen side-stepped their responsibility before God, saying, "It's the pastor's job, not mine," the Christian cause was set back years. Stop a moment and think how the Christian enterprise got started in the world. It got going as plain people like ourselves, who had experienced the transforming touch of Christ, felt an urge to share with others what they had received.

Personal Interest in Souls

The kind of evangelism I am pleading for does not necessarily consist of huge mass meetings, brass bands, and massed choirs. It is not pretentious and does not specialize in the stunt approach. It begins right where you live and work and study. Its message is the warm response of your own soul to Christ. It is not at all pretentious, but brings amazing results when it is operative. Some of us are already at work, bearing a vital witness of word and deed. And as more and more of us come under the spell of Christ and share his life with others, wonderful things are in store. Our ultimate aim is not to inflate church membership statistics, but to bring Christ closer to men.

George W. Truett, one of the foremost soul-winners of our generation, loved to tell of a faithful Sunday school teacher in his church. She summoned her pastor into a classroom one Sunday. Pointing to her group of boys, she indicated that every one of them had personally committed his life to Christ and sought baptism and membership in the church. Dr. Truett said that, as he looked into the face of that humble, faithful Christian worker, he regrasped the meaning of the phrase "personal evangelism." In still another church, a hundred men banded themselves together and went out in the name of their Master to claim others or him and his cause; everywhere they went, to business, service clubs, the various social circles, their own homes, their close neighbors, they urged the claim of the Redeemer and his cause upon men. The result? One hundred new recruits for the Master were brought into the Christian fold. But is that all? No, for each man felt his own spiritual pulse quickened. A man in still another church, who had been used of Christ to win others, made this frank admission: "I found out that I coul not share what I did not possess, so I went deeper."

We must realize that the kingdom of God will not come closer by means of merely negative, resistant strategies. One gets tired of all this talk about "defending" the Christian church and heritage. The fact is, we must regrasp the inner intent and meaning of the Christian gospel. For the gospel is a radiant, positive, confident reaching out to the unsaved and lost in the mighty name of Christ. It is divine-human initiative in the making of Christian history—a deliberate taking of the battle to the stronghold of the enemy—primarily the spiritual indifference and the moral languor of our day.

What can we do? We can each go to some quiet place, kneel down before the One who loved us and gave himself for us, and pledge our lives anew to him for the evangelization of men.

When Christians are revived they will become winners of souls.

A young Indian girl was asked by her high school teacher to write something about Socrates She wrote:

"Socrates was a Greek philosopher who went about giving people good advice. They poisonted him"

Dr. Thomas E. Poag Elected

Dr Thomas E. Poag, Director of the Division of the Humanities and the Tennessee State Theatre Project was recently notified by Dr. William Halstead of the University of Michigan and Executive Secretary of the AETA that he had been appointed to the Executive Council of the American Educational Theatre Association. Dr. Poag will represent the Southern Association of Dramatic and Speech Arts of which he is President. This is the first time in the history of this association that a Negro has been extended this honor. Dr. Poag is recently praised by Robert C. Schnitzer of the American National Theatre Academy for his superb ability in play directing. Dr. Poag is the founder of Beta Kappa Alpha, a Speech and Drama Honor fraternity; a member of the Omega Psi Phi fraternity; Worshipful Master of James A. Myers Masonic Lodge, A Royal Arch and Knights of Templar Mason; a 32nd degree Mason; and a Shriner.

Dr. Darkes Albright of Cornell University is the President of the AETA. The conference will meet at the Statler Hotel in Washington, D. C., December 27-30, 1948.

The Hoptoad

By Jennie Roy Flautt

I walked out in the garden
With Mother yesterday
When it was late and sunshine
Had faded all away.
We saw a little hoptoad
With great big staring eyes,
Which hopped away so quickly
After looking very wise.
"He's such an ugly thing," I said,
"Why does he come, oh, dear!
To sit with all our lovely flowers—
I think he spoils it here."
"Now darling, don't you know God made
The frog as well as flowers?"
Asked Mother, "and he likes to live
Among these plants of ours.
He eats the insects that destroy—
A harmless fellow, he;
In daytime, when it's very hot,
Each plant's for him, a tree."
And then, quite suddenly, I thought
Of fairy tales and faces—
This was the hoptoad's kingdom,
And he was going places.

PREPARATION FOR USEFULNESS

A Britisher visiting the United States was charmed with the American Beauty rose, and procured some bushes for his own fine garden. They failed to produce the type he had expected and, after repeated failure, he appealed to a gardener for advice. It was finally agreed that the gardened would undertake the rearing of such roses on three conditions.. First, that the owner leave home for a day while he worked with them; that he would pay for the work before he left, and lastly, that he would be willing for the necessary work to be done. This was complied with, but on his return the owner viewed his garden with despair. What havoc had been wrought among his valuable shrubs! Scarcely more than bare stalks remained. That year he had his heart's desire, lovely American Beauty roses! "Every branch that beareth fruit, he purgeth it, that it may bring forth more fruit." When the Lord would prepare a life for usefulness, he lays the groundwork in suffering. — THE WESLEYAN METHODIST.

Unreserved Consecration

By William A. Ashby

God's way is in the sea. We cannot trace it, though we scan the oceans with the eye of an eagle. We cannot trace; we can trust. It is the trusting heart which is caused to hear the Word of the Lord through the turn of circumstances, the influence of its fellows, the call of duty, and the inner still small voice of the Spirit. Adopt a listening attitude Godward.

Life is full of shadow and sunshine;; and in the unending variations of the path of life we are given the opportunity of proving our love and witnessing to our faith. Truly, we walk by faith and not by sight; yet we see One who changes not, the same yesterday, and today, and for ever; and he is our Guide.

"I'd rather walk in the dark
with God,
Than go alone in the light."

To any who especially need some such message, may I quote Wordsworth's strong, true words—words that put iron into the soul and hope into the heart?

"One adequate support
For the ealamities of mortal life
Exists—one only; an assured belief
That the procession of our life, howe'er
Sad or disturbed, is ordered by a Being
Of infinite benevolence and power;
Whose everlasting purposes embrace
All accidents, converting them to good . . .
Faith absolute in God, includes hope."

"Whom having not seen, ye love; in whom, though now ye see him not, yet believing, ye rejoice with joy unspeakable and full of glory" (I Peter 1:8).

God, who speaks to us in many ways, and draws the souls of men to himself along different avenues, also calls into his service many different kinds of laborers. How foolish, then, we are when we desire to put all into one mold, and give to all one task, and that to be earried out along eertain prearranged lines. Let us learn wisdom—to every man his task—diversity with unity; many gifts (persons), many talents, but one Spirit and one Lord. (I Corinthians 12.) This should make us slow to judge and quick to take courage. The Lord has need of all and will use all who will be subject to his conditions, whereby he makes men meet for his use.

Hudson Taylor, in one of his memorable messages, gave the sole condition to be observed by the servant of the Lord, whether possessing many talents or one. Said he: "Are we before him in unreserved conseeration? I do not say in profound intelligence. I do not say in extraordinary natural or spiritual attainments. I do not say strong in faith, but I do say in unreserved conseeration. We do not need to know. He knows; that is enough. We cannot love ourselves as he loves us. Oh! let us trust him fully, and now if never before, now afresh, if often before, take Jesus as our Master and Lord, and with unreserved conseeration give over to him ourselves, our possessions, our loved ones, our all. He is infinitely worthp; and he infinitely makes up to us all we give to him. For in return for our little all, he gives us himself and his great all."

This expression, "unreserved consecration," was the great secret in the life of Hudson Taylor. His life and appeal called forth into the field a thousand workers for China's millions. What does this tion" mean to us? Can it be that call to an "unreserved consecrasome of us have not honestly faced the situation? Why should it be a natural and proper thing to sing about a life of consecration, but a strange and peculiar thing to talk about and consider outside the influence of pubilc worship, and still more strange a thing to recognize as really affeeting the common round and trivial tasks of our workaday lives?

The Gospel Crosses The Artic Circle

Margaret T. Hills

Librarian, American Bible Society

He had never seen a tree until he was forty-eight, nor a camel, nor running fresh water, nor a city or even a large town. But now he has translated the Gospel of Mark and the Epistle to the Romans for his own people, most of whom, like himself, will probably never see some of these objects that are commonplace in the lives of most men.

"He" is Roy Ahmaogak, a Christian son of Christian parents, at Point Barrow, 300 miles above the Arctic Circle, on the very northern point of Alaska. For years he has served as a teacher in the local schools, for his own eighth-grade education was supplemented by a course of reading under a missionary's direction. For years also, he served as aid and interpreter to missionaries and preachers, and more recently as lay leader of a congregation in Wainwright. He has also lived as a trapper and hunter, married a school teacher and is the father of eleven children and now has two grandchildren. He had had years of experience in putting into his own language for his people the word-of-mouth messages of the English-speaking preachers and missionaries. But there was no Bible or any part of it for the Christian community of twelve hundred people, of whom seven hundred were church members and about eight hundred of whom could read.

In 1946 Mr. Ahmaogak was elected by the Yukon Presbytery the elder commissioner to the General Assembly of the Presbyterian Church, U. S. A., and arrangements were made for him to spend a year "out" in special study and language work. Imagine the new experiences for such a man! Although he had read much and seen many pictures, all the activities and life of large towns and the countryside south of the Arctic Circle were new, fascinating and also highly confusing! In quick succession there came the meetings of the General Assembly at Atlantic City; visits with a retired but long-loved missionary in his home in Indiana; July and August at the Summer Institute of Linguistics at Norman, Oklahoma, where Dr. Eugene Nida and John McIntosh helped him get his language into written form, prepare a primer and begin on a translation of the Scriptures. The primer was planned not only to help his people learn to read their own language, but to famialiarize them with some of the terms and objects to be met with in the Bible, so many of which had no place in their daily lives.

Then came the fall, winter and spring in New Jersey, where he studied at Bloomfield Seminary. There were visits to the zoo to see camels, lions and sheep; and trips to the Bible House in New York to consult with Dr. Nida on the translation. When summer came again, the translation was finished and Mr. Abmaogak returned to Alaska, where on June 3, 1947 he was ordained by the Yukon Presbytery—the second of his people to become a church official. The day after his return he hitched up his dog led and went for a long trip out onto the ice, glad to be back where all was so quiet and peaceful. But civilization has caught up with even the northern coast of Alaska. Oil has been discovered, and the new minister and his church realized that they must face the challenge which an invading eivilization would bring. To meet this challenge they needed a Book.

The Eskimo dialect into which the Scriptures have been translated differ so greatly from that used by the 3,000 people living in Point Barrow and the region stretching for 500 miles east and west of it, that they cannot be used by these people, who call their language the Inupiat dialect. There are, however, family characteristics among all the dialects. There are prefixes and suffixes, and words which form combinations that must be kept together. Some languages have a variety of vowels. Barrow Eskimo seem to hace more problems in the use of consonants. There are three "n" sounds, four "I's", two "k's" and two "g's" but there are lacking the sounds of "r" and a number of other consonants common in English. For instance, St. Mark is "Maagum."

There are also problems in expressing unfamiliar objects in terms the Eskimos can visualize without constant use of a Bible dictionary, which very few would have, so a literal translation of Mark 1:6 into English would read:

And John was clothed bighumpanimal hair and hadabelton a pieceofskin and dideat insectsthatjump and beesnottamed thatwhichbeeseat.

Although the translation was completed in the spring of 1947, type difficulties held up its printing until this year. In july 1,000 copies of St. Mark were shipped to Alaska. It is to be hoped they arrive before the winter. Last winter the Eskimos had been supplied with their primer provided by the Presbyterian Board of National Missions. In March they were asking Mr. Abmoagak "When are we going to get the translations of the Bible?" and "Be sure to save me a copy when the books come, in ease I am out of the village." He wrote: "Our people here have enjoyed learning how to read and write the Eskimo language gfrom the Eskimo primer, and words fail me to express my thanks to Dr. Nida of the American Bible Society for the help and encouragement he gave me in praparing it for our people." Both Eskimos and whites have been using the primer. Now, during the long dark days of this winter they will have the Gospel to tell them in their own language, translated by one of their own folks, clearly and thrillingly the story often only half understood before. The Epistle to the Romans is now being printed by the American Bible Society and perhaps it, too, will reach Point Barrow before transportation, except by air, is cut off for the winter; for it willh elp the church eommunity to comprehend more fully the wonders of salvation.

Sewing Hints

By Mary Ann Knowitt

COUCHING:

Couching gives a raised line on a flat surface. A heavy yarn or thread laid along the design lines is fastened down with a lighter weight "tying down" yarn or thread. Transfer patterns are available in the pattern and needlework catalogues. Braiding designs also can be used for eouching. The edges of applique are often finished in this way. For heavy lines that follow the deign use a good grade of KNITTING WORSTEAD in single, double or triple trands; COTTON RUG YARN, single strand, or PEARL COTTON in double or triple strands; NEEDLE NO. 18 is suitable for the heavy yarns and threads. For tying down, use MENDING WOOL with KNITTING WORSTEAD, PEARL COTTON or BRILLIANT with knitting worstead or COTTON RUG YARN. or BRILLIANT with PEARL COTTON. NEEDLE NO. 7 is suitable for tying down threads.

Stamp or trace the design on the right side of the part of the dress to be trimmed. Beginning at one end of a line, bring the heavier yarn through from the wrong side. Guide this yarn along the line of the design, holding it in place with the thumb of the left hand. Bring the tying-down yarn and carry the tying-down yarn along on the wrong side of the material, then bring it through to the right side at regular intervals over the heavy yarn. Draw the stitch fairly tight down in this way. Blanket stitch and catch stitch worked from left to right can be used also. In some places it is more effective to make several rows of eouching close together. Bead and sequin trimings are often combined with yarn couching for very rich trimming. Be sure to write this newspaper, sending a stamped, self-addressed envelope for a free copy of the "A B C's of Croehet."

Housebroken: An adjective once applied only to well-behaved dogs and cats. Now applied to anybody who buys a home at prevailing

Conservation: One who does not think that anything should be done for the first time.

How To Mount Pressed Flowers

M. T. Martindale

Most everyone at some time or other has pressed flowers, only to find that they will soon crumble or fall apart. Here is a way you may mount a whole bookful, this fall.

You may press the flowers between the pages of a book if you first place a clean paper around the flowers to prevent staining the pages. Or you might make a press by clamping two boards together in a vise or quilting frame clamps.

For best results select flowers that have just opened, and press as soon after picking as possible. Place a pad of clean paper on one board. Arrange your flowers as you wish it to be in your mounting book. Put another pad of paper on top, then the other board. Clamp together and lay away in a dry place for several days, or until thoroughly dry.

Place the flower carefully on the page of your mounting book. Cut a piece of cellophane about one inch longer and wider than the flower. Put a small amount of glue or paste on all edges of the cellophane and press it in place over the flower.

Underneath, you may write the name of the flower, date of pressing and where you got it.

Cellophane is very plentiful now. You find it around packages of coffee, beans, dried fruits, stationery or what not. If you save it as the packages are emptied, rolling it up instead of folding it when you put it away, you will have all you can use.

If you wish, press pretty fall leaves in the same way, for another book.

Work Well Done

Have you ever finished a job and asked your mother or someone else to come see what you have done? Of course you have. You were proud of your work, weren't you?

You have a right to be proud of your work when you do it well. You can always find satisfaction in doing your best, even when the results are not quite as good as you hoped they would be.

God Himself, when He made the world, looked at His work and saw that it was good. That is one way in which you can be like Him.

And God saw every thing that He had made, and, behold, it was very good.—Genesis 1:31.

The Magazine Game

By Louise Hedgecock

A stack of old magazines can be lots of fun. A very interesting game can be played with them. There can be any number of players, provided everyone has a magazine. Each one turns to the first page of their magaine, and they then decide on some object that they must find. For example, say the object decided on is a baby. Everyone starts turning the pages in their magazine trying to find a pieture of a baby. The first one to find a baby picture gets ten points. The next object could be a car. Each object counts ten points. The first one to gain fifty points wins the game.

Juvenile Delinquency And Something About It

By C. N. Bagwell

Let us look at a few factors that are responsible for this misbehavior that we eall Juvenile Delinquency.

Young People are products of those who rear them, and very well represent those persons who have had charge of them most of their life. Of course there are exceptions to a rule.

Solomon says in Proverbs 22:6, Train up a child in the way he should go, and when he is old he will not depart from it." Good training must be done by precept and example. Maybe too many of us have failed because we used only precept Method.

Is not it common-sense to think that delinquent children are the offsprings of delinquent parents; or in a case where their parents did not rear them, it would be attributed to whoever did rear them.

This world is not run by the young people, most of the business places that I know about are run by grown-up people. If it is a place of disrepute and a young person goes there and buys something that will make him do wrong and get into trouble, well an adult is to blame and maybe he is a parent.

Before we say that the young people are going to the dogs, we should look around to see if we are not leading them there. No, I refute the statement that the young people are going to the dogs. Some of the finest people whom I know are Young People. I remember very well when I was in my teen age, how I used to shun or keep from the company of some of the adult people whom I knew because they did things that I though were not right; and

Before we say that the young people are going to the dogs, we according to the standard set by the Bible for right, they were not right. On the other hand I have known some grown up people whose lives have been an inspiration to me and others who knew them. They were good people.

All adult people have eome through the natural stages of human growth and development. Quite a few of us I suppose are proud of the fact that we were not carried down to degradation by the current of social and moral corruption.

We should create for our Youth the kind of Environment that will not only be conducive to a good living but to a Good Life. The Churches and the schools as well as the Homes are held responsible for the molding and shaping of the character of these Young People.

A Merry Christmas and a Happy New Year to all of you.

Writer Says Time Has Come For Our Women To Make Some Changes

New York— Columnist Leonard Hall of the Global News Syndieate, makes the provocative suggestion that women should make a number of changes in their ways of life to have happy marriages and to make their men folk better. His current column, "The Bell Tolls" is as follows:

WHAT OF OUR WOMEN?

This has always been considered A MOOT question. But the time has now come when we must seek to find some way to answer this question to the satisfaction of all concerned. For as we steadily forge ahead in our quest and attainment of greater rights and opportunities we must be ready to accept and hold the gains made with credit to the race.

This cannot be done unless our women become more conscious of their own duties and position in the community and as the weakest link of the racial chain. For no chain is stronger than its weakest link. And our women, at present, are our weakest link in many ways. Many of them, in fact too many, are totally unaware of the duties of marriage. Too many accept this American institution as a means of obtaining freedom from parents, as a means of securing rest and security for themselves alone, the husband be hanged. Others have never learned the true meaning of the word "helpmate" and consequently never use it practically in marital life. Still others blunder through life confused with the idea that even though they are poor still they must live like they are rich.

Then, there are so many of our young women who are the products of the War era, when they found it both profitable and exciting to roam about the country in order to keep in touch with their serviceman boyfriend or husband. Many of these learned too much in too short a time and are still confused as to what to do with their knowledge.

The Secret of Service Challenge

You want to be of service to others. You would like to be of the most possible service to mankind. You would be happy if when your work is over on earth your fellow men could speak of your career of service.

Very well. But how can you reach such a goal. What are the steps in the path of service? For you are aware that no one can reach the goal by accident. You cannot depend upon chance. You must form some very definite purposes in your heart. And you must carry them out with energy and fidelity, despite difficulties that will beset your path, and perils that may menace your safety. But if you have it in your heart to live the life of service, Samuel can teah you a lesson.

Begin early. Is there such a thing as beginning too early? Think of Hannah, the praying mother of Samuel. Think of the pious yearnings of her noble soul. Think of the vow she made in the national sanctuary. Think of her devout spirit as interwoven with the inmost fibers of Samuel's being. Good antecedents mean very much in the making of men. Not everything, to be sure; but nearly everything. A stream seldom rises higher than its source. A son is not apt to be better than his mother. Perhaps you have no hope of equaling your mother in character. But her holy marks are upon you. And you are glad. She yearned for your usefulness before you were born. Her very best—body, mind, and soul—she gave you in your most formative years. She set your feet in right paths. She lifted your eyes to the hills whence cometh your help. She taught you to lisp the name above every name. She carried you to the sanctuary and dedicated you to God. Have you lived up to her ideals? Have you helped to carry out her vows? Did you begin early, and have you been faithful? If not, begin now!

Listen to God. He has come within speaking distance of you. He lifts his voice so that you can hear. He calls you by your own name. He has something for you to do. He is willing t use you in the carrying out of his plans. Is there something in you that responds to his call? Sometimes perhaps you may not realize that it is he who is calling you. You may think it is some human voice that summons you to simply an earthly duty. The voice of God is addressing you directly and exclusively. Let your soul tingle at his summons. Gird up the loins of your mind. Answer with the boy Samuel: "Speak, Lord; for thy servant heareth." Listen to God and learn. Listen to God and discover the path to pursue. Listen to God and he will open to you the gates into a larger life.

You love peace. You want the world to be at peae under the banners of the Prine of Peace. You still live in a warring world. You cannot eseape military duty in the army of Immanuel. There is fighting to be done. Therefore, you are called upon to fight the good fight. But like Samuel you can fight oehind the breastworks of the altar of Jehovah. He crected the altar before he raised his Ebenezer. He offered sacrifices before he was able to dediate a monument on the battlefield. It was Jehovah who helped on that day of days. The Philistine yoke could not have been thrown off by the Hebrew warriors alone. Jehovah fought with them and fought for them. And so their foes were instantly and utterly routed.

You must find the same thing true in your own life. Erect your altar and offer your sacrifice. Face your foes with eourage. Look heavenward with confidence. Join in the battle when fighting must be done. Conquer in the name of God and for his glory. You an live the life of vitory. It is yours to be triumphant here as well as hereafter.

It may be neessary for you sometime to stand aside for others. This does not mean that you are not appreciated. It does not mean that you ought really to be supplanted. It may mean as in Samuel's case that the desire for your suecessor is not justifiable. However, the pressure of eircumstances will prevail. But remember that the overruling hand of God is still upon the situation. He will permit people to have second best if they will not have the very best. So it may lie within the province of his purpose for you to step aside and let another take your place as Saul succeeded Samuel. But Samuel did not show chagrin. He did not exhibit a bitter spirit. He did not give way to resentment which would incapacitate him for further leadership. Indeed, he retired from the judgeship with such consummate taet and in such splendid spirit that he gained rather than lost in the esteem of the people. That is a profound secret which many a leader has failed to learn. You may lose without losing out. Indeed, you ma gain by losing, but you must lose in the right spirit. Be ready to stand aside for others when it is the proper thing to do.

If you are following the purpose of God in your life, the likelihood is that when you lose one position, there is another waiting for you. It may not be exactly what you want. It certainly will not be a duplicate of that which you have lost. But it will be the best place for you to work on and to work out the will of God in your life.

Think of Samuel retiring from the julgeship of Israel. He did not feel that his wings were elipped by his constituents, but rather they were released so that he could soar at will in the upper air instead of being engaged largely in business and political matters. He was able then to give himself solely to spiritual things. He was the adviser of Saul and his court. He was a prophet among his people. He was the interpreter of his time. And e perpetuated his work by founding the schools of the prophets. The brightest young men of the Hebrew monarchy sat at his feet. Indeed, he gave an impulse to commonwealth and kingdom which was felt for good long after his own sun set at Ramah.

So you are not only to live in the light yourself, but lead others also into the light. And if you lead others into the light, you will live the life of service. And no life of service is spent in vain for like the path of the just, it does not deepen into darkness, but brightens with the dawning light more and more unto the perfect day.

W. Augustus Johnson, Former Texan Dies in California

Former Political Leader and Civic Leader in San Antonio, Texas—Retired Mail Carrier

(NEGRO PRESS REPORT)

New York, N. Y.—Special—Nov. 4th, W. Augustus Johnson died at his home, 11719 Wilmington Street, Los Angelcs, California, after an illness of seven years. He was a native and former letter carrier in San Antonio, Texas; a retired Letter Carrier of Los Angeles, and prominent churchman. Back in the eighties, he was secretary of the old Idlewild Social Club of San Antonio, Former Secretary Bexar County Republican Convention and the 19th of June Celebration Committee of which Henry Allen Boyd was the president. Funeral services announced for Friday of this week in Los Angeles. He is survived by wife, Mrs. Bertha O'neal Johnson, one daughter, a host of relatives and friends.

Poplar Bluff, Mo -(UP)- Osear Berry was in a hurry when he brought his piekup truck from the farm to town for some mechanical repairs. "Got to go back so the five baby birds in that nest under the rear fender ean get their regular meal," he told the mechanic as he hurried through his work.

Catholic Priest Scorns Governor's Charge That FEPC is "Communistic"

Father John M. Hayes, Texas, Criticizes Ben Lacey, Arkansas Governor, And Urge Passage of FEPC Law

San Antonio, Tex. — Special— Writing in the **Alamo Register** here, Father John M. Hayes has severely criticized the statement of the Honorabel Ben Lacey, Governor of Arkansas, that FEPC legislation is a "Communistic idea."

Fr. Hayes eomments: "Now, if the Governor had said: 'I don't like it,' or 'It won't work,' and let it go at that, we could at least feel that he respected our intelligence. But when he tries to hang the handy Red label on it, it is fairly obvious that he has put us down for bumpkins, gulls, greenhorns."

Recalling the fact that for several years the chairman of the Federal Fair Employment Practices Commission was Most Rev. Francis J. Haas, Catholic Bishop of Grand Rapids, the priest notes:

"The Pope does not appoint Communistics to Bishoprics. The Pope, Governor, is against Communism. He has absolutely no use for it. And Bishop Haas is not one to be easily hoodwinked. He could tell our neighboring Governor more in five minutes about the real danger of Communism than Ben is likely to discover in a lifetime."

Referring to the Catholic organizations which have urged the passage of FEPC legislation, Fr. Hayes cites the Social Action Department of the National Cathoic Welfare Conference, the Catholic Committee of the South, and the Catholic War Veterans.

The priest points out that in three states where FEPC legislation has been enacted, 1,226 cases of alleged discrimination were dealt with, all of which were settled by conference, conciliation, and persuasion, without invoking against the employers the penalties provided by the law.

"It was necessary to have penaltics in the law to convince employers (and some unions) that the state war serious in its purpose," Fr. Hayes observes. "But the penaltics were not invoked."

Urging the passage of the federal FEPC legislation, the priest notes: "In the very states where FEPC laws have been functioning successfully officials agree that a federal statute would be of great benefit. It would extend and make uniform fair practices and would strengthen the position of existing commissions.

"States' rights?", the priest continues. "Yes, of course. But no state has any right to perpetuate injustice or to stand idly by while injustice flourishes within its borders, or to get in the way of corrective federal measures. If a state is incapable of doing its duty it is obliged to stand out of the way of a higher authority which is ready to restore justice. And job-justice is mighty important. A man has to earn a living and feed his family no matter where his ancestors come from."

National Association For Advancement Of Colored Peoples' Testimony Instrumental In Bringing About Decision

President H. C. Byrd of University Announces Negro Applicants Will Be Considered Next Fall For Graduate Work

Baltimore, Nov. 18.—The National Association for the Advancement of Colored People learned today that its testimony had been instrumental in bringing about the decision of the University of Maryland to admit qualified Negro students to its graduate school. Dr. H. C. Byrd, university president, announced this week that Negro applicants for graduate work will be considered next fall "on a basis of qualification alone" and qualified students accepted "on an integrated basis."

The NAACP position was outlined on Oct. 22, at a hearing granted to the Maryland Committee for Equal Educational Opportunity by the Board of Trustees of the University of Maryland. At this meeting NAACP assistant special counsel Franklin H. Williams testified that he could find no federal or state law or judicial opinion justifying the existing discriminatory policy against Negroes.

Mr. Williams pointed out that although graduate courses at the University were maintained by the State of Maryland "out of public funds raised by taxation of all citizens, regardless of race, creed, or eolor," the only graduate facilities available for the use of qualified Negroes were those of the school of law which opened its doors to colored students following a court decision in 1935.

"It would be unfortunate," declared the NAACP attorney, "for the State of Maryland to have to face repeated and numerous actions in the courts of the state before electing to do what is its elear constitutional obligation to do immediately. Accordingly, it is again urged that this Board immediately issue a public statement of policy affirming the right of every eitizen of the state to be considered for admission to graduate and professional courses and degrees on the basis of his qualifications, without regard to race, creed or coor . . ."

Competing With War

If—even during the height of the war an entire devision of men had been killed, and more than a corps had been maimed, the nation would have been shocked with horror.

Yet fire does that every year. It does it on a piecemeal basis, of eourse. But that does not make the total any less terrible. Close to 11,000 lives a year are now given to it through carelessess and ingoranee. And the tol of the maimed and burned and crippled is about 50,000. Its depredations are especially great among small children. many of whom become lifelong invalids.

Early in October, the nation celebrated Fire Prevention Week, as it does each year. A vast amount of work was done during the week to awaken the country to the menace of fire, and to teach us how fire may be prevented. But if the publie works on the "out of sight, out of mind" basic, the Week will not bear full fruit. Fire prrevention, to be successful, must be carried on day in and day out. It must beeome a routine part of living in all homes and all places of work. It must be as automatic as eating and sleeping.

When that is accomplished, fire's toll of death and injury will be a property loss which has been cut enormously—to say nothing of costing us more than $700,000,000 a year.

Predominately-White Texas Order Has Its First Negro Nun

Sister Anne Marie Of Bastrop, Texas, At Holy Cross Hospital In Austin, Texas

Austin, Tc., Nov 25 — (Spl.)— Austin's first Negro Catholic nun, and the first Negro nun in a predominately-white order in Texas, is at Holy Cross hospital here.

She is Sister Anne Marie, a native of Bastrop, Tex., who worked at the hospital when it was started about eight years ago. Becoming interested in the Missionary Sister of the Immaculate Conception, the Catholic Sisters who work at the 'hospital, the Bastrop woman becamc a Catholic and later applied for admission into the Sisterhood.

Having made her novitiate, a period of spiritual training, at the Sisterhood's motherhouse in Paterson, N. J., Sister Anne Marie was received as a nun on August 13. She arrived back in Austin last week.

Before becoming a member of the Order, Sister Anne Marie was Oliva Williams.

There are some communities of Negro Catholic Sisters in San Antonio and Houston, but Sister Anne Marie is the first nun outside such a community in Texas.

End U. S. Job Jim Crow; Groups Ask FEPC Board

President Truman's Fair Employment Board Asked To Take Action

Washington, Nov. 18.—Action to end segregation in Federal employment has been asked of President Truman's Fair Employment Board by the National Association for the Advancement of Colored People, the Congress of Industrial Organizations, and the American Veterans Committee.

"We believe that the Board has a clear duty to advise all Frederal agencies that segregation in employment or facilities provided for employees is 'odious to a free people' and eontrary to Federal Policy," the communication stated, dated November 12. It was submitted by George L. P. Weaver, Director of the National CIO Comittee to Abolish Discrimination; Robert Carter, Director of Veterans Affairs of the American Veterans Committee; and Clearence Mitchell, Labor Secretary of the NAACP.

The statement asked that the Board consider the prevention of discrimination as its major function rather than "the mere correction of such individual complaints as may arise." On individual complaints, the statement, asked that the procedure for handling them be uniform throughout the Federal Government and such procedure "embrace the right of employees to be represented on the Boards established by the agencies to hear such compaints and also to be represented by counsel of their own choosing."

In commenting on remedies for persons who are the victims of discrimination, the statement indicated that "no machinery for handling eomplaints will be adequate unless it provides that the vietim of discrimination shall be given redress in the form of appointment, promotion, or transfer, as the case may be."

Warns of Crisis in Rail Cars to Mobolize Army

Predicts Near Ban on Civilian Travel

If the United States becomes involved in a war, and millions of men are drafted, prospects of Mary visiting her G. I. Joe in any of the training camps will be slim because of an anticipated bottleneck in rail passenger cars, according to Col. W. J. Deyo Jr., 5th army transportation officer.

Deyo made his prediction, in an address here recently before a seminar of national guard and reserve leaders from the 12 states of the 5th army area.

Deyo said that altho American railroads are in better shape than they were in 1939 in regard to rights of way, frate cars, and locomotives, national mobilization will compel rationing of passenger space to trips vital to the national economy

Trend To Fancy Coaches Cited

This, he said, is due to two factors: the trend to fancy coaches and sleeping cars which carry fewer passengers, and the loss of old cars, snatched from the junk heap in the last emergency, and which now have been scrapped.

Old stlye coaches carried 68 to 72 troops as compared with 44 to 50 in the new ones. The old style sleeping car had room for 39 to 49 persons, while new room type cars carry only 22.

Deyo said it had been suggested that the country might build more troop sleepers, like the 4,000 constructed in World War II. Production difficulties, he said, would probably prevent speedy construction of troop sleepers.

Altho the trend is to fancy new passenger cars, he added, such progress is slow. A new sleeping car costs $140,000 compared to its formed cost of $100,000.

SHIFT TO DIESEL POWER SLOW

Similarly, altho the trend is to the diesel engine, Deyo said one big line estimates it would take 25 ycars to completly change over.

If such a trend continues, Deyo warned that the roads would lose older men who knew steam locomotives, so that if the old "tea kettles" were needed in an emergency, there would be few engineers available.

The question of frate cars is improving, a fact of interest to the army since to move a modern infantry division of 17,702 men, it requires 25 passenger trains and 50 frate trains. Manufactures are now producing 10,000 frate cars a month, Deyo said.

1,680,959 CARS ON HAND

The total servicable frate cars on last May 1 amounted to 1,680,-959, an increase of 104,673 over 1939.

As an example of how the passenger load has varied, Deyo gave the following figures:

1916-'21 (war) 1,042,149,667;
1932-'41 (peace) 465,161,712:
1942-'47 (war) 807,347,359.

He suggested it may be necessary to build railroads to connect with training camps and industries which under the threat of the A-bomb, would be more widely dispersed.

New Paint Developed by U. S. Laboratory Using Soybean Oil

New York, Nov. 18 (AP)—A new white- paint, made with soybean oil by depatment of agiculture scientists, was announced today to the American Oil Chemists society.

The work was done at the northern regional research laboratory of the department, at Peoria, Ill., and reported by A. J. Lewis, J. C. Cowan, and N. C. Schieltz.

The new paint is for outside work. Soybean oil has been used previously in paint, but did not dry fast enough, so that some chamical compound had to be added. The new paint uses only soybean oil and it dries quickly.

Most Fruit-Bearing Trees Should Be Planted Now

By Dr. Floyd Bralliar

Fall is an excellent time to plant nearly all kinds of fruit bearing trees, and this fall, according to Dr. Richard P. White, executive secretary of the American Association of Nurserymen, there is a fine and varied supply of fruit trrees of all kinds available.

He also says, that since World War II began, more fruit trees have died than have been planted, and the replacements are badly needed on the grounds many homes and in many small home orchards.

Nurserymen in regions where there have been heavy frosts are now digging trees and will continue filling orders until the ground freezes.

Of all foods eaten, fruits and vegetables have made the largest gain among the chief items in the American diet in the last 40 years. Therefore many home owners will continue to be interested in fruit-bearing plants. In addition to the public's desire to have fruit to eat. an increased appreciation is noted in the decorative value of fruit trees.

More and more architectural plans include one or more fruit trees in a terrace or somewhere else close to the house in informal planting. Fruit trees can also be used on ornamental planting on the front lawn, if the right variety is planted.

There is a great difference in growth in the various kinds of apples. The most beautiful shaped apple tree, we know of, is also highly desirable for its fruit, this is the Transcendent crab.

FORMS PYRAMID

The tree naturally forms an almost perfect pyramid, if not interfered with by wrong pruning, and makes a first-class shade tree. In the spring it is literally a mass of large pink flowers; it also matures a crop of high-class fruit early in the fall. This fruit is unsurpassed in quality, for canning, making crab apple jelly, butter or any other purpose for which apples are used.

One or two good pear trees planted in the side yard, will not only be a source of exceptional beauty at blooming time, but if the Duchess variety is used you can count on a good crop of large pears early fall, that rates as tops for quality and can be kept until after Christmas. This pear is as fully blight resistant as any pear that you can get. We know of at least one tree that has been bearing regularly for almost 40 years without receiving any special care, more than is given to all fruit trees.

USE PEACH TREES

If the lawn is a large one, a place may be found for growing three or four peach trees. The blossoms and fruit add color and beauty to the surroundings of any home, and there are few sights more beautiful than a well-grown peach tree loaded with ripening fruit. Furthermore, in the winter, when the branches are bare, many fruit trees have beautiful, interesting lines and remind the onlooker of the flowers and fruit of the coming year.

We believe that every family who has room for it, should plant a small apple orchard. If there is room for only four or five trees, plant that many. And a dozen will provide more apples than any family will use. The apple is a long-lived tree, capable of bearing fruit regularly for half a century. It pays to set the trees for enough apart so that they will not harm each other 20 years from now, They should be set from 36 to 40 feet apart each way, and great care should be used in planting them so that they will get a good start in life.

HUNDREDS OF VARIETIES

There are hundreds of varieties of apples on the market but the following are good for a small family orchard in the South.

For a first early, we know of no better apple than Yellow Transparent. This apple has its faults but it is extremely early, a regular bearer of good-sized fruit, and of the highest quality for cooking or eating. At least two seedlings of this variety has recently been produced in Tennessee, and are rapidly winning a place among fruit growers. Both of these varicties, like their mother, are yellow in color, but both are later than their mother. Both are claimed to be more resistant to disease, but neither have been tried long enough to be sure of this.

To follow immediately the Yellow Transparent, we recommend Mountain June. This originated as a chance seedling found growing on the Highland rim about 40 miles north of Nashville. It is a red apple about the size of the old Ben Davis or perhaps a little smaller.

It is almost solid in color. It has good quality, either for eating raw or cooking. While few people consider it outstanding in flavor, it has the best quality of any apple in season and it is a heavy and regular bearer.

FOUND IN CAROLINA

Next in season is the South's most popular apple, Golden, or as it is commonly called Yellow Delicious. This apple was found as a seedling growing on the side of a mountain in North Carolina. No apple bears large crops more regularly than does the Golden Delicious. and it is safe to say that there is no better flavored apple in existence for cooking purposes. It comes into bearing very young and is exceptionally free from diseases. Properly harvested and stored it can be kept in the ordinary home until Christmas, and if put in cold storage it keeps much longer.

Staymans Winesap, or as it is commonly called now, Stayman, is the largest, juicest, and finest flavored of all the Winesaps. It matures about a month later than Yellow Delicious, and keeps about a month longer. It also is of Southern origin and therefore, it is a heavy and regular bearer of large apples.

The next apple that we recommend for homc use, is the Virginia Winesap. It is almost pure red in color and ripens later than any of the other varieties we have mentioned. It is a heavy bearer of medium or almost medium sized fruit. Though it is a little undersized, everybody knows it and likes it. It can be kept longer than most of the other apples, and for a late, maturing home apple it is unsurpassed. We know there are plenty of people that will differ with us on some of these varieties, but we feel sure after taking council with many experts, that for the Middle South no other varieties surpass these for the home orchard.

First Aid for Angina Pectoris

There are times when a little knowledge of the heart disease may be of great value in dealing with heart attacks. One of the most common is angina pectoris. The main symptom of this disease is pain in the chest, usually under the breastbone or in the pit of the stomach. This pain may radiate down the arm and is described as tightness or squeezing in character. Quite frequently it is attended by vomiting, and naturally is thought to be an attack of acute indigestion The only first aid that can be given in the home is to have the patient sit quitely until the pain subsides. If the patient has been under the care of a physician he will usually carry nitrogycerin tablets given to him by the physician. One of these tablets should be placed under the patient's tongue. If the pain or vomiting continues, a doctor should be called at once. The recognition of this type of heart attack, not putting it down as just indigestion, and seeking medical aid at once, may save a person's life.

Survey Shows that One-third of Next Generation Will Be Good Wives

New York, N. Y.—A survey, now under study at this date indicates that approximatcly one-third of the girls now attending high school are preparing themselves to make good wives. The survey has proceeded no farther than seven states. including North Carolina, Virginia, Kentucky, South Carolina, Texas, Mississippi, and Georgia, but will eventually cover all the southern and border states, where the school systems are absoluately separate.

The survey is being conducted to ascertain how many high school girls are preparing themselves with all-around home-making (Home Economics) courses. That is: cooking, crocheting, sewing. knitting, embroidery, child care, etc. The prime reason for this survey is to determine actually how many Negro girls are really taking Home Economics seriously as an avocation.

Since it is to be automatically assumed that the majority of Negro girls who marry won't be fortunate enough to have husbands who can provide the servants, which would make up for the lack of home-making knowledge on the part of the wife, it is reasonable to assume that the girl who majors in Home Economics in High School will be better prepared to administer the affairs of the home than the girls who didn't take Home Economics.

The report from Kentucky shows at this point of the survey, that more than fifty per cent of the Negro girls in high school in Kentucky are majoring in Home Economics; therefore it is reasonable to assume that a man who marries a girl from Kentucky will marry a girl better prepared to administer the home, thereby giving their marriage a better than evcn chance of surviving. North Carolina is the next highest, with approximately three-eights of its registered Negro female students taking Home Economics. South Carolina is next, with onc-third of its female students. Texas ties with South Carolina. Returns on Georgia are not complete, but, present indications show that their young women didn't particularly go in for the subject. Two eights of the girls in Virginia seem to be majoring in Home Economics, whereas the returns from Mississippi aren't complete.

We will be able to announce the complete findings at an early date, but present indications show that mothers and fathers can be better assured that junior's stomach will be well filled with properly prepared food, and his home will be better kept if he marries a Kentucky girl.

Submit Applications for Membership

High Time Negro Singers Be Members of the Metropolitan Opera Company Submits Applications for Metropolitan For Thigpen, Holland and Hall

By Neil Scott

It is high time that Negroes become members of the Metropolitan Opera Company, the nation's greatest musical organization. The circumstance of color predjudice should rapidly be ended which, until now, has kept the golden tones of some of the world's finest singers from ringing through the mighty halls of the Metropolitan Opera House. Even as the barriers against Negroes playing professional basket ball, football, tennis, golf, being heavyweight champion of the world have been torn down, so must Negro America now gird itself for an all out fight to see to it that our men and women of vocal, histrionic and artistic might, get their chance to gain fame and fortune in the opera houses in the United States.

There is no question but that Marion Anderson, Dorothy Maynor, Carol Brice, Ellabelle Davis, Larry Winters, and other gifted Negro artists, if given the incentive and the opportunity to appear in Americas major opera houses, they would more than hold their own. Each of the artists named above has widespread following among music lovers who pay hundreds of thousands of dollars each year to hear their golden voices, and thrill to their artistry. Yet, none of these artists are members of the Metropolitan Opera Association. No Negro has trod the stage of the Metropolitan, singing an operatic role. Certainly Marion Anderson and Carol Brice could match the vocal prowess of any two other contraltos presently members of the Met; the same holds true for Miss Davis and Miss Maynor, as regards sopranos.

Taking into consideration the fact that the Metropolitan is a jim crow institution, it is high time that the battle to get Negroes into that organization was begun. Accordingly, I have submitted the names of three talented Negroes for the Metropolitan Opera Auditions of the Air; Mr. Charles Holland, a golden voiced tenor; Miss Helen Thigpen, a silken voiced soprano, and Mr. James Hall, a basso profundo. It is my intention to submit the names of many other young Negro singers, if they will contact me for one of the application blanks for the Metropolitan Opera Auditions of the Air. I am calling on all Negro musicians, newspapers and civic leaders to join with me in the fight to break down the jim crow barriers at the Metropolitan Opera House. The following letter is self explanatory:

Miss Helen McDermott, Sec.
Metropolitan Opera Auditions
of he Air,
230 Park Avenue.
New York 17, New York
Dear Miss McDeramott:

I should like to take this opportunity to thank you for your courtesy in supplying me with application blanks for the Metropolitan Opera Auditions of the Air.

We have submitted to you the names of three fine vocal talents, whose applications attest to their qualifications to be contestants in the Metropolitan Opera Auditions of the Air, and as prospective members of the Metropolitan Opera Company.

Mr. Charles Holland, Miss Helen Thigpen, and Mr. James Hall are only three of the thousands of gifted Negro vocalists who desire the opportunity to compete to be members of the nation's greatest musical organization, (The Metropolitan Opera Company).

I sincerely hope that every courtesy will be extended these young artists, and that they will be granted every opportunity to display their vocal prowess in an effort to become members of the Metropolitan Opera Company.

We will be submitting other names to you at the earliest possible moment. Again let me thank you for your courtesy. I remain

Sincerely yours,
NEIL SCOTT

Contact Neil Scott and Associates, 400 Manhattan Avenue, New York 26, New York for an application blank for the Metropolitan Opera Auditions of the Air.

Cast Down Your Bucket Where You Are

When Booker T. Washington said to his people "Cost down your bucket where you are" he never dreamed that one day these words would be dramatically visualized for the thousands of visitors who annually visit his birthplace.

Just outside of the "big house" not more than 50 feet from the replica of the log cabin in which Booker T. Washington was born stands a beautiful fully built well curbing with bucket, drawing wheel and rope. Above it is printed in bold relief these words of Booker T. Washington which have travelled the world over—"Cast down your bucket where you are." Among the many interesting sights at the Birthplace none attracts more attention than this well—stamping its valuable lesson upon the minds of all who read it.

Many visitors drop coins into this "well" and make wishes. We don't believe in magic but we know that dreams can be made to come true by following Booker T. Washington's advice.

Booker T. Washington Service Memorial a Monument of Interracial Good-Will

Throughout the many books and articles written by Booker T. Washington he always gave credit to the fine men, women, and groups of other races, who so generously helped him in his struggle upward. In keeping with this spirit we would like to direct attention to a few of the many members of the white race who have so graciously and generously helped in the efforts to establish a Memorial to Booker T. Washington. Because of space limitations we can only mention a few here but it is a fact that when this memorial shall have been established it will be one of the greatest monuments of interracial good will that this nation possesses.

When the birthplace of Booker T. Washington was put up for sale, the daughter of Booker T. Washington, Mrs. Portia Washington Pittman, went to S. J. Phillips, the present President of the Booker T. Washington Birthplace Memorial, and asked him to find a way to purchase the plantation on which her father was born. In response to her appeal Mr. Phillips went to the Nehi Corporation of Columbus, Georgia, by whom he was employed. He told Mr. C. C. Colbert, President of the Corporation, Mr. T. H. Stanley, General Sales Manager, and Mr. Wilbur Glenn, Treasurer, of the many contributions that Booker T. Washington had made to the American way of life, and what the preservation of his birthplace would mean to future generations. He then asked for a loan of sufficient size to buy the plantation. Without any collateral, the Nehi Corporation supplied Mr. Phillips with a cheek to purchase the plantation at "whatever the cost." This was done nearly three years ago. Since that time until the present day the Nehi Corporation has made Mr. Phillips' time available for the development of the Memorial. His name has never been taken from the corporation's payroll even though he works night and day in the interest of the Memorial. Truly has the Nehi Corporation given evidence of "interracial good-will."

When the Board of Trustees of the Memorial decided to ask the Commonwealth of Virginia to make an appropriation for the development of the Booker T. Washington Birthplace Memorial, the matter had to be presented to the Virginia General Assembly. Hon. Walter L. Hopkins, a member of that body, graciously accepted this task and secured an appropriation of $15,000. He was also among the first to purchase a supply of Booker T. Washington Memorial half dollars to distribute among his friends, and was one of the first white men to accept membership on the Memorial's Board of Trustees. He has contributed much to the present status of the Memorial. In this connection it can be stated that Governor Tuk and all of Virginia's Senators and Representatives have also eooperated wholeheartedly in the efforts to establish the Memorial.

Senators Harry F. Byrd and A. Willis Robertson, together with Congressmen W. M. Abbitt, S. O. Bland, J. W. Flannagan, Jr., Porter Hershy, Jr., B. P. Harrison, J. Vaughn Gary and Howard W. Smith, all of Virginia, are on the Memorial's Board of Governors Other white members of the Board include Senator James P. Kem and Congressmen Claude I. Bakewell and Clarence Cannon of Missouri; Congressmen Harold D. Cooley, Carl T. Durham, and John H. Folger of North Carolina; Senator Kenneth McKellar and Congressman Clifford Davis of Tennessee; Congressman George Grant of Alabama; Congressman Brooks Hays of Arkansas; Congressman William Lewis of Kentucky; Congressman Emory Price of Florida; Congressman J. P. Richards of South Carolina; Congressman Wingate Lucas of Texas; Mr. M. W. Clement, President of the Pennsylvania Railroad; Mr. C. Donald Dallas, Chairman of the Board, Revere Copper & Brass, Inc.; Mr. Chas. H. Diehl, President Empire City Savings Bank; Dr. Francis P. Gaines, President Washington and Lee University; Mr. Frank E. Gannett, President Gannett Newspapers; Mr. William Green, President of American Federation of Labor; Atty. Mortimer Hayes, New York City; Mr. Harry Martin, President Ameriean Newspaper Guild; Dean Ernest O. Melby of New York University; Dr. Alonzo Myers, Chairman, Higher Education, New York University; Dr. Paul C. Reinert, Dean St. Louis University; Dr. Robert G. Sprout, President University of California; Dr J. D. Williams, chancellor University of Mississippi; Dean Carl Wittke, Oberlin College, and Mr. Frank Stanton, President of the Columbia Broadcasting Company. For all of these men to take time out of their busy lives to help to build a memorial to a humble American is indeed more than a gesture of interracial good will.

Among other white friends who have given full measure of support may be listed Mr. Victor L. Anfuso, Commander of the Knights of the Holy Sepulchre, who secured the cooperation of the Catholic Clergy of New York; His Eminence Bishop Oxley, Bishop of Brooklyn, who sent his cheek for $1,00.; Rabbi Fiebleman of New Orleans, who used his influence to get the Higgins Foundation to contribute $1,500; the late Senator Carter Glass and Congressman Burch, who introduced bills in the Senate and House to secure coinage of $5,000,000 Booker T. Washington Memorial half dollars to be sold at a premium to help in the cause. The 80th Congress that passed the legislation, President Harry S. Truman who signed the Bill, Mr. McBride, clerk of the committee, Mrs. Nellie Ross Taylor, Director of the Mint, who has cooperated in the distribution; the entire Federal Reserve Banking System that has given splendid cooperation, the hundreds of Trust and Savings Banks which have sold more than 50,000 Memorial coins; The People's National Bank of Rocky Mount, which has served as our Treasurer—Mr. J. P. Davis, Vice-President of this bank, and all of his fine staff of workers; Attorney Russell Davis, of Rocky Mount, who is a member of our Board of Trustees; the press of the nation that has given us millions of lines of publicity; the majort networks and thousands of local broadcasting stations—particularly WROV in Roanoke—that has given us more than a year of sustaining time for a good-will program.

Dr. Louie B. Newton, of Atlanta, and the Southern Baptist Association have cooperated with us. So also has Dr. Lowe and the Baptist Radio Commission. Misses Gladys Swarthout and Carmen Miranda who flew all the way from the west coast to participate in a Booker T. Washington Birthplace Memorial Program which was presented in Carnegie Hall, New York. Mr. Earl Wilson and Mr. Arthur Godfrey who served as Masters of Ceremony on this program; Mr. Sydney S. Baron, of New York, who put $30,000 of his money in a fund raising campaign; Mr. George McDonald who has used the Dixie Hand Book to publicize our efforts; Mr. Fred Splawn, of Montgomery, who serves on our Board of Directors; Kiwanis, Rotary and Lions Clubs which have purchased thousands of Booker T. Washington Memorial half dollars and white business organizations, manufacturing plants, mills and factories oo numerous to mention in this limited space—all of these are but a few of the many members of the white race who have worked and are still working with us to establish a Service Memorial to honor Booker T. Washington. These re some of the many reasons that lead us to say that when this Memorial is established it will be one of the greatest monuments of Interracial good-will in all America.

It is said of Sir Walter Scott, when his dog "Camp" died, that he declined to go out to dinner on the ground that he had just lost a dear friend. It is when the dog gets old and dim-sighted, and follows its master and mistress about like their shadow, that we first begin to feel how close is the relation between the dog and the man.

Memorial Mops on Market

"Mops" under the trade name of "Booker T. Washington Birthplace Memorial" are being placed on the market in the Commonwealth of Virginia and other areas. These mops are being turned out by the thousands in the "Mop Factory" which has been recently instituted at the Birthplace.

The work is being done largely by Veterans and has been established to help to publicize the Birthplace as well as to serve as a small source of revenue to help to maintain the educational program which began at the Birthplace on October 1st.

Other small business activities will be initiated from time to time to help liquidate the cost of operation. A canning plant which will handle the large supply of vegetables which the Memorial farm produces, as well as serve as an outlet for surplus food raised by the 23,000 farmers in this area will, perhaps, be the next unit put into operation.

You Can Help Build a Better Southland

The Booker T. Washington Birthplace Memorial is carrying on a program that deals directly with the well being of one-third of the population of the South. What affects this large portion of the population of any area affects, the entire area. Money, labor, publicity, good will and prayers are needed in the doing of this gravely needed job. Everybody can help. If you are a Southerner of large means your contribution to the Memorial would do a world of good for our section. If your means are limited you ean help in proportion.

Even people of very limited means have the opportunity to give a hand. In the early days Booker T. Washington was given a half dozen eggs or a pig, by the poor. You would have to be rich to do this today but you don't have to be rich to help by purchasing Booker T. Washington Memorial half dollars at $1.00 each or taking out a subscription to "The Southern Letter."

For Human Betterment

A short time ago, in connection with Oil Progress Day, the presidents of three Rhode Island colleges issued statements on the oil industry.

Mr. Robert J. Slavin, president of Providence College, said, "What of means to the community, to the state and to the nation cannot be minimized . . .Indeed, the entire world depends in a great measure upon petroleum and everything possible should be done to further the interests of this industry, which works for the welfare of the people."

Henry M. Wriston, president of Brown University, said, "The health of both the individual and the nation is dependent upon further progress in the oil industry. We congratulate the industry upon its achievements of the past and its promise for the future."

Carl Woodward, president of Rhode Island State College, said that the oil industry "has shown a rare capacity to adjust its operations to meet the demands of the moment . . . We have a sense of indebtedness to the petroleum industry."

Praise such as this, from informed educational leaders, is not gained by chance. It must be earned through performance—and that is exactly what oil has done. The magnificent war record of the American oil industry is too well known to need description. It has been called upon to meet a postwar demand far greater than anyone could have anticipated. It is now developing oil resources in almost every far-flung corner of he world. It is a powerful force for human betterment.

OPEN

A SAVINGS ACCOUNT

And

Add To It Weekly Or Monthly

You May Deposit In The Citizens Savings Bank And Trust Company, Nashville, Tennessee By Mail—This Bank Is Just As Close To You As Your Postoffice

Here is how it is done. Just send a postoffice money order, the cash by registered mail or a certified bank check to Henry A. Boyd, President of the Citizens Savings Bank and Trust Company, Fourth Avenue, North at Charlotte Avenue, Nashville (3) Tennessee, for the amount of money you wish to deposit in the opening of your account. The bank will then enter your savings account, or checking account, which ever one you prefer, in your name or in the name of any person you wish to make the deposit. They will also send you a Signature Card so you can sign the card just as you want your checks signed, when you are ready to make withdrawals, but please indicate whether you want a regular checking account which does not draw interest, or a savings account which draws interest. Savings accounts in this bank draw interest at the regular one per-cent per annum. The interest is credited January and July of each year.

This bank is a member of the Federal Deposit Insurance Corporation, which Corporation insures each account in the bank up to $5000.00. This bank is now forty-five years old.

Protecting the Food Supply

Country Gentleman recently published an editorial dealing with one of the most important yet least understood problems confronting the American people. The theme of it is found in its title and subtitle: "America's advantage must be maintained. Only by protecting our sources of abundant food can we continue to lead the world."

Few of us realize the extent to which our standard of living is dependent upon food which is moderately priced in relation to incomc. Over a long period of time, food has taken only about 24 per cent of our spendable personal income. The balance has been left to buy other things—the things which kep industry going and employment high. As the Country Gentleman said, "Nowhere else in the world has so much been left. . to be used in raising the general standard of living." In other countries, by contrast, the cost of food accounts for as much as 70 per cent of the average worker's arnings. Little remains for anything else—so industry lags and living standards are low.

The Country Gentleman recommends a two-faceted program to assure an ample and permanent food supply—first, adequate safeguards for farmers, and, secondly, conservation of soil and other productive resources. The first is being accomplished. The seond offers a challenge to farmers, and others, to prevent the exhaustion and depletion of the land by adopting proven farming proesses that make for conservation and soil maintenance.

To cite a current example, the nation needs more meat animals. They furnish food and put fertility back in the soil. Meat animals make food of grasses, fodders and waste products which are not suitablc for human dict. Consumption of meat has tended to rise while supplies have tended to decline. To achieve greater production we must have fair prices to encourage producers. Food is the basis of the Amerian economy.

Farmers Co-ops' Part in Rural Health

Washington, D. C.—Many groups of farmers have taken a hand in improving rural health service according to a report just issued by the Farm Credit Administration. These farmers working with others in rural communities have found they can work together to provide much needed services and spread the costs for health services in much the same manner as they have teamed up to market their products and furnish services and supplies cooperatively.

This report outlines in detail—by use of seleted examples—three systems of prepayment plans designed to make it easier for farm families to absorb such costs—prepaid hospital service, benefits in cash from insurance companies, and local cooperative associations that give health servies under a local budget plan.

In Minnesota, for example, hundreds of farm families through their local co-ops have joined a health association, the Group Health Mutual, Minneapolis, which aims to apply cooperative principles of membership participation. This association started by insuring only against the expense of hospital service. It now offers what it calls a double protection policy combining insurane for hospital bills with insurance for doctors' bills.

In some localities, groups have gone still further, forming rural health cooperatives to bring needed health services into the rural community. This report discusses four pioneering rural health cooperatives which have set up hospital, clinic, and health services. They are the Farmers Union Hospital Association, Elk City, Okla.; Northwest Community Hospital Association, Mooreland, Okla.; South Plains Cooperative Hospital Association, Amherst, Tex.; and Achenbach Memorial Hospital Association, Hardtner, Kas.

In addition, many farmer cooperatives have joined in health discussion and planning councils. have contributed to funds for building local hospitals and clinics, have helped finance medical students, and made many other moves to try to help improve the health of their areas.

For those communities where nothing much has been done so far, the report gives a step by step outline of what they can do to set up a rural health improvement program, pointing out the need for a thorough planning study to decide what needs to be done, whether it can be done, and how to proceed to do it.

No Equal

In a recent speech, L. P. Shield, president of Grand Union Company, traced the development of chain stores, and said that chains, in hitching mass distribution to mass production, "have made one of history's great contributions to our economic system."

In the past 15 years the country has witnessed some especially fine examples of chain store service During the depression, for instance, the chains made particular effort to move surplus or "distressed" foods, and the economic value of this to the American farmer was tremendous. During the war, the chains were leaders in cooperating with the government in the difficult work of keeping prices to legal levels, fighting black markets, and distributing goods in an orderly fashion in a time of scarcity. And since the war, the chains have been at the forefront in the battle to keep prices from running completely out of sight, and to market goods at a minimum cost and profit.

The value of chain merchandising has not been confined to such work as this. Other kinds of stores, faced with chain competition, had to keep up with the march of progress or fall by the wayside. The independents adopted many chain policies, and came up with new and attractive innovations of their own. They have held their share of the business, and are giving the chains plenty of tough competition. Thus, every phase of merchandising has been influenced for the better.

A mass production economy must have mass distribution to move the goods. American retailing has no equal in the world.

Competing with War

If—even during the height of the war—an entire division of men had been killed, and more than a crops had been maimed, the nation would have been shocked with horror.

Yet fire does that every year. It does it on a piecemeal basis, of course. But that does not make the total any less terrible. Close to 11,000 lives a year are now given to it through carelessness and ignorance. And the toll of the maimed and burned and crippled is about 50,000. Its depredations are especially great among small children, many of whom become lifelong invalids.

Early in October, the nation celebrated Fire Prevention Week, as it does each year. A vast amount of work was done during the week to awaken the country to the menace of fire, and to teach us how fire may be prevented. But if the public works on the "out of sight, out of mind" basis, the Week will not bear full fruit. Fire prevention, to be successful, must be carried on day in and day out. It must become a routine part of living in all homes and all places of work. It must be as automatic as eating and sleeping.

When that is accomplished, fire's toll of death and injury will be cut enormously—to say nothing of a property loss which has been costing us more than $700,000,000 a year.

Who Makes the Gains?

The radicals' classic complaint against capitalism is that it tends to concentrate the wealth and ome of the nation in the hands of a relative few, at the expense of the many.

That ancient cliche is still in use. Yet the truth is that just the opposite has occurred. The greatest gains in late years have been made by people in the lower and the middle-income groups. As an example, in 1941 there were 4,139,000 families in the $3,000-$5,000 bracket—last year there were more than 13,000,000. And, in 1941, only about 1,500,000 families had incomes over $5,000, while last year the total reached almost 7,000,000.

Last summer a survey was made to find out what classifications of people were better or worse off than in 1930, after making allowance for changes in taxes and living costs. Such representative labor groups as coal miners, railway workers, etc., were all better off, and by a wide margin. But typical groups of executives, and stock and bondholders were worse off.

No economic system in history has done as much as our free enterprise capitalism for the so-called common man. The radicals are trying to hide that fact.

"A phenomenon of postwar operations, common to every industry, is that without having had any erious voice in the matter, industry's energies have been progressively diverted from its central purpose of making things people want to buy. Industry has been used to product the financing of the 'free' services rendered by governmental agencies. The impact f taxes has grown great enough to force its way directly into virtually every business decision."—K. T. Keller, President, Chrysler Corporation.

Protecting Living Standards

A director of research for a large organization retail stores has said that efforts will be made to still further lower the overhead costs of retail business. In some parts of the country roadside stores, which can be operated cheaply, are opening up. And that, he went on, "may be the first indication of a new form of competition for large retailing establishments."

The interesting thing about that is the light it casts on the competitive situation in mercrandising. And it shows, as well, how impossible it is for any kind of store to gain anything approaching a monopoly. In the days when chain store taxes were being advocated, the argument was that they were necessary to keep the independent from being squeezed ut of business. A Federal tax of this nature came within an ace of becoming law. But it was beaten—and the independent kept on doing business at the same old stand, and they are better off than ever.

In retailing, there is always room at the bottom for the small operator to gain a foothold—and there's plenty of room, too, in the middle and at the top, for the man who is willing to work, has the necessary experience and adequate financing, and knows how to offer the public goods and services which meet its approval.

Retailing has done a fine job in cutting its costs of doing business, and it is always looking for ways and means to do a better job still. The consumer gets the benefit—either in lower prices, or in the prevention of price increases that would otherwise occur. And that's one way to protect American living standards.

SPACE SAVERS

If you are living in cramped or makeshift quarters, you can save space and add an attractive note by replacing end table with small drawer cabinets. You will be surprised at the amount they will hold.

Overlooking the Goose

At the recent convention of the United Mine Workers, a great deal of discussion centered around future demands that the union may make on the soft coal operators. The indications were that these will include still higher wages, still shorter working days, an increase in vacation payments, and so on down the line.

The desire of any working group to get as much it can is understandable. However, in the case of the coal miners, this raises the extremely pertinent question of just where the limit may be. At the present time, 60 cents out of each and every dollar taken in by coal producers goes for labor costs. The industry's profits have been moderate. The only way out, therefore, would be to again boost the cost of coal to the consumer—and that is where the danger lies.

Coal, vital as it is, must be sold in intense competition with all other fuels. If the price should become too high, there would be greater use of these other fuels, and a consequent deline in the use of coal. And then the miner's high-wage jobs would deline.

Right now soft coal miners are the highest-paid industrial workers in the world. They have made spectacular gains, not only in wages but in living and working conditions, and a long list of other tangible benefits. It would be the part of wisdom for them to consider how they may help protect the market for the product that supports them—rather than imperil it with excessive perennial demands.

YOUR CHANCE OF FIRE LOSS

This year, according to the president of the National Board of Fire Underwriters, fire will enter one out of every 100 American homes. In those homes, it will kill thousands of people, at least 2,400 of them children. And it will leave a ghastly toll of ruin and waste behind it.

If you happen to be one of the lucky ones whose home escapes fire, you may think its no problem of yours. You'll be dead wrong. The burden of paying for fire falls on all of us. A fire which destroys a great forest or a producing factory makes every American poorer, in loss of taxes, jobs, purchasing power, and national resources. Fire is the enemy of employment, production, and a high standard of living for the people.

Every American, as a result, has a direct and personal interest in fire prevention. His life and his home and his business are at stake. And so, going beyond purely personal considerations, is the economic health and prosperity of the community and the country. The billions that go up in smoke and flame are lost to us forever—and so are the lives of those who are burned to death.

Soon we will be in a new year. It can be a year in which loss of life and property by fire is cut to a fraction of past totals. Or it can be a year in which, because of our carelessness and indifferene, destruction rages on. It is up to us to make the choice.

Foot and Mouth Disease

Fear among some Mexican farmers that vaccination may serve to spread foot and mouth disease are without foundation, says Dr. B. T. Simms, nationally known veterinary, authority and chief of the U. S. bureau of animal industry, Recent reduced "some resistance" among Mexican farmers to the vaccination program now being carried on jointly by the United States and Mexico in an attempt to stop the spread of foot and mouth disease below the border. As long as foot and mouth disease vaccine is manufactured carefully and tested before it is applied to livestock, there is no danger that it will spread the disease, Dr. Simms states.

Sex Hormoner May Reduce Swine Production Problems

Skilled use of sex hormones in hogs offer a possibility of bringing more pork to American dinner tables and of easing the multiple problems of swine production at the same time, according to a report in a national veterinary journal.

Dr. L. M. Hutchings of Purdue university, writing in the Journal of the American Veterinary Medical association, said this hormone technique was developed by Prof's. H. H. Cole and E. H. Hughes of the University of Calif.

Injection of the hormone, equine gonadotropin, into sows after the fortieth day of lactation shortened as much as two to four weeks the period between successive farrowings, Dr. Hutchings stated.

In addition to shortening the farrowing season, use of the hormone would allow greater lifetime production per breeding animal, at least one extra litter per sow, provided farmers could adpust their feeding and management schedules to meet the stepped- up production program.

Effectiveness of the hormone is attributed to its marked stimulating action on the ovaries. In the hands of experts, it was over 95 per cent efficient in bringing about desired results the writer said.

No Substitute

Charles F. Kettering is one of the most famous engineers and inventors this country has produced. He has made a statement about the railroad industry which is worth repeating. "No matter what other forms of transportation do," he said, "or what new ones come into being, the railroad will remain the backbone of transportation. The amazing progress made by the railroad in their first century is only a promise of what they will do."

We all take railroad service for granted. The trains are always there, ready and able to do a job, when we need them. And back of that is a tremendous, dramatic story of the industry's growth and progress and improvement, often in the face of the most difficult obstacles. No other enterprise did so much to build the continent, to tie its far-flung regions together, and to make for a unified nation.

Yet, good as their service is, the railroads are never satisfied. A short time ago, for instance, the Association of American Railroads completed arrangements to build a new railroad research laboratory on the campus of the Illinois Institute of Technology at Chicago. Its purpose is to promote and speed the many-faceted work which will make the railroads of tomorrow far better than even the fine railroads of today.

The railroads have interconnected every section of a far-flung nation in a single century. Still, as Mr. Kettering said, that is only a promise of what is to be done in the future. The industry never stands still. It is always in transition—always looking for ways to better serve the great country which supports it.

Happiness in this world, when it comes, comes incidentally. Make it the object of pursuit, and it leads us a wild goose chase and is never attained.

—Nathaniel Hawthorne.

If there is righteousness in the heart there will be beauty in the character. If there be beauty in the character, there will be harmony in the home. If there is harmony in the home, there will be order in the nation. When there is order in the nation, there will be peace in the world.

—Chinese Proverb.

The Beatitudes are fragements of the autobiography of Jesus.

Mattie D. Babcock

WOMAN'S PAGE

KEEPING HOUSE
by Norma Crane
FAMOUS HOME ECONOMIST

Ironing Not So Bad; So you hate ironing? Many women make it comparatively easy. Here's how it's all in the way you do it! Hang the wash as straight as space permits. Fold things neatly as you take them in from the line. Put away the things which don't require ironing. Do your flatwork as soon as you take it off the line. You'll find that some of the moisture from the fresh air is retained by the clothes, and ironing at this time is twice as easy. The wash blanket is half empty now and the remainder doesn't look so dreadful. What's left is the "special work:" rayon, cottons, and starched pieces. Sprinkle them with warm water and roll up tightly in a turkish towel to keep them uniformly damp. Don't dampen more than you will iron at one time, as clothes mildew easily when left dampened too long. A light weight iron will prove far less tiring and just as efficient as a heavy one. Sit down when you iron, using either a high stool for a standing ironing board or a kitchen chair for a low set ironing board. Cover the board with a white, lintless fabric which can be tubbed and bleached frequently.

Care For Electric Cords: Your electrical equipment is only as good as your electric cords, so take care of them. Always grasp the plug itself, not the cord, when disconnecting from an outlet. Keep occasionally with a duster or (if rub-them dry and wipe them off oc berized) with a damp cloth. Never find them around a hot appliance and don't wind them tightly. Keep them looped loosely over a hook or, if attached to the appliance, loop in the place provided for it. all knots and kinks should be smoothed out.

RECIPE OF THE WEEK

Raisin Bran Flake Muffins
1 cup sifted flour
3 teaspoons baking powder
3-4 teaspoons salt
1 beaten egg
2-3 cup of milk
1-4 cup molasses
3 tablespoons melted shortening
1 cup bran flakes cereal
1-2 cup raisins

Sift the flour, baking powder and salt together. Combine the egg, milk, molasses, and melted shortening, then add to the flour mixture, stirring only until the flour disappears. Fold in the bran flakes and raisins. Fill greased muffin pans about 2-3 full and bake at 425 degrees F. for 20 to 25 minutes. Yield, about 10 medium sized muffins

A Little of This and That: Lace adged rayon banding is available for sewing to the hems of too-short slips, thereby attaining the "New Look" at a saving. It comes in three lingeric colors . . . Extra thin sliced bacon is now to be had, 30 to 32 slices to a pound instead of 20, which is average. Grand for sandwiches and salads, but cook it slower and turn it over frequently because it will burn if cooked like the regular thick kind Have you bought one of the new automatic needle threaders which works so simply that you can thread a needle without even looking? It's really something you won't want to be without!

Be Pretty When You Walk: Study yourself in front of a mirror or have someone check you until you acquire the length of step that is best for your height and the length of your legs. A short person taking short steps looks stumpy. A tall person taking too long a step reminds one of Gulliver. You look graceful walking with relaxed legs and knees, while taking suitably sized steps. Find the one that suits you best and then practice it over and over until it becomes habitual. The popular trick in Grandma's day was to balance a book on the head while walking in order to improve the posture and the carriage. This is still a recommended practice in the modeling schools today.

HONEY FRUIT CAKE
1 cup prunes
1 cup dried apricots
1 cup golden raisins
2 cups seedless raisins
1 cup blanched almonds
1 cup walnut meats
1 1-2 cups finely cut citron
1 cup finely cut candied pineapple
1-2 cup thinly sliced candied cherries
1 cup finely cut candied orange peel
1 cup finely cut candied lemon peel
1 cup chredded cocoanut
2 1-2 cups sifted all-purpose flour
2 teaspoons baking powder
1 1-4 teaspoons salt
2 teaspoons cinnamon
2 teaspoons allspice
1-2 teaspoon nutmeg
1 1-2 cups shortening
1 1-4 cups honey
6 eggs

Rinse dried fruits and dry thoroughly. Cut prunes from pits into small pieces. Slice apricots fine. Shop almonds and walnuts. Combine dried fruits, nuts, candied fruits and peels, and cocoanut with 1 cup flour. Sift together remaining flour, baking powder, salt and spice. Cream shortening thoroughly. Blend in honey gradually, and beat well. Beat eggs thoroughy and add slowly to creamed mixture, blending well. Beat in sifted dry ingredients. Pour batter over floured fruit mixture. Mix thoroughly. Pour into 10-inch tube pan which has been lined with 2 thicknesses of brown paper and 1 of waxed paper. Bake in slow oven (250 degrees) 4 to 4 1-2 hours with shallow pan of water in bottom of oven during baking. Remove from pan to cool. Allow to ripen 2 to 4 weeks before cutting. Makes about a 7 pound cake.

CONVALESCENT FARE

If there is an invalid in your family, don't forget to include plenty of protein in his diet. Animal protein, such as meat, is especially valuable to people recovering from disease, wounds, surgery or burns.

MEND IT

If your favorite lamp shade is torn and you do not want to part with it, place cellophane tape over the ripped part and it will be as good as new.

NO WASTE

Mix margarine in a casserole when you plan to bake in it on the same day. Then the casserole is guarded and ready for baking, with no margarine waste.

Tips on Turkey

If your family is small, a quarter bird, affording your preference of white or dark meat, may be just the thing about which to plan Thanksgiving dinner

By MARRY LYLES WILSON

Turkey transforms everyday dinners into special occasions, but it is not necessary to have a large family or a number of guests to enjoy turkey. A quarter turkey can now be purchased at many meat counters, either light or dark meat, frozen and wrapped in an attractive package. This furnishes enough turkey for a family of two to four, with leftovers for another day.

To cook a quarter turkey, place it on a rack in an open pan and rost in a slow oven (325 degrees F.) for three to four hours.

If you want a whole turkey, buy a hen turkey if you want an 8 to 15-pound bird, a tom if you want one weighing from 16 to 25 pounds. The marks of quality are a clean waxy skin with few pinfeathers and no bruises or discolorations; well-fleshed brest and legs; streaks of fat under the skin on breast, legs, thighs and back; a short bady and broad brest. Frozen turkeys should be frozen hard and show no discoloration.

Slow cooking by dry heat on a rack in an open pan is the best method for roasting a turkey. It requires no water, no basting, no cover. Low temperatures assure better flavor and appearance, less shrinkage and less loss of juices. And a shallow pan allows the heat to circulate around the bird, roasting it evently.

TO ROAST A TURKEY

Rub the cavity with salt (one-eight teaspoon per pound of bird). Put enough stuffing in neck to fill it out nicely, and fasten neck skin to back with skewer. Stuff cavity well, but do not pack tightly. Truss bird and grease skin thoroughly with melted or softened cooking fat. Place on rack in shallow pan. Cover top and sides of bird with fat-moistened cloth, preferably clean white cheesecloth. Place in 325-degree ovcn. Do not scar. Do not cover Do not add water. Moisten cloth with fat from bottom ofpan if cloth dries slightly during cooking.

To tell whether turkey is done, press the fleshy part of the drumstick with fingers, protecting them with cloth or paper. If it is done the meat will feel soft. Or move the drumstick up an down—if the leg joint gives readily or breaks, your turkey is done. If you use a meat thermometer, your turkey will be done when thermometer placed in the center of the inside thigh muscle registers 190 degrees F., or when one placed in the center of the dressing registers 180 degrees F.

No turkey dinner is complete without smooth. rich brown gravy, and a good stuffing. To make good turkey gravy, follow this tested recipe.

TURKEY GRAVY
3 tbsp. drippings
3 tbsp. flour
2 cups liquid
Salt and pepper

Pour drippings from roasting pan into a bowl. Skim off as much fat as possible and put three tablespoonsfull into a saucepan. Measure three tablespoons of flour into the fat. Blend thoroughly. Measure meat juice and add giblet stock, milk or water to make up two cups. Set fat and flour mixture over low heat, stirring constantly. Cook until frothy. Add cold liquid all at once; stirring constantly until thickened. Boil briskly about five minutes. Season to taste with salt and pepper. Serve boiling hot. Yield: About two cups.

SAVORY DRESSING
5 cups crumbled corn bread
5 cups stale bread Broth to moisten
1-2 tsp. thyme
1 tsp. poultry seasoning
1-2 cup minced onion
1 cup celery, cut fine
Turkey liver, rub to a paste
1-2 cup melted butter
2 eggs

Moisten bread slightly. Add other ingreadients. Add beaten eggs and butter last.

TURKEY TIMBALES

Mix two cups chopped left-over turkey meat and one egg. Season with salt and pepper. Line wellgreae cdsustard cups with this mix ture, leaving an opening in center for dressing. Make dressing by mixing one and one-half cups bread crumbs, one teaspoon poultry seasoning, one teaspoon salt, one-fourth cup melted fat and three tablespoons hot water. Press dressing into center of the cups. Bake about 30 minutes in a moderate oven (350 degrees F.)

TURKEY HASH
3 cups chopped cooked turkey
1-2 cup chopped celery
1 large onion. Broth
2 hard-cooked eggs

Chop onion fine and brown in a little fat only until a delicate color. Add two tablespoons flour Simmer in the broth until onions are tender. Strain, mashing the onions through. Season with salt, pepper and a dash of cayenne. Add enough broth to make three cups liquid. Add celery, which has been cooked only until tender in a little water. Add turkey. Heat slowly. Serve on tost points in toast cup or with rice, potatoes or grits.

ORANGE CAKE WITH CHOCOLATE SUNDAE ICING

Steep 1-4 tsp. orange rind in 1-2 cup strained orange juice 5 min.; strain. Combine orange juice with 1-2 cup milk.

Sift together in a large bowl:
2 1-4 cups sifted cake flour
3 teaspoons double-action backing powder
(4 tsp. single-action)
1 teaspoon salt
1-14 cups sugar

Add:
1-2 cup Snowdrift
2-3 cup orange-milk mixture

Mix until flour is dampened. Beat 2 min. If you beat by hand and take "rests," count beating time only. (For electric mixer, use "low speed"; scrape bowl and beater often.)

Add:
2 eggs

Remaining orange-milk mixture Beat 1 minute. Turn into 2 greased 8-inch layer pans, with bottoms lined with thin plain paper. Bake in moderate oven (375 degrees) about 25 min. Cool 5 min.; remove from pans and cool. Put together with—

CHOCOLATE SUNDAE ICING
2 egg whites
1 1-2 cups sugar
1-2 teaspoon salt
1-4 teaspoon cream of tartar
1-3 cup water
1 teaspoon vanilla
3 squares unsweetened chocolate
1-2 teaspoon Snowdrift

Put first five ingredients in double boiler over water. But with rotary beater 7 min. until icing peaks. Cool; add vanilla. Ice cake Melt chocolate with Snowdrift over hot water. Cool slightly. Spread over top and allow to drip down sides.

Kedgeree is a combination of cooked flaked fish, cooked rice, parsley and salt and pepper; be sure that the parsley is finely chopped. Melted butter and an egg yolk may be added to the mixture to bind it together tnd then the whole thing reheated gently.

ORANGE NUT BREAD

3 cups sifted flour
4 tsp. baking powder
3-4 tsp. salt
1-4 cup granulated sugar
2 tbsp. granted orange rind
1-4 cup shortening
1 egg well beaten
1 cup milk
1-2 cup orange marmalade
1-2 cup nut meats

Sift together flour, baking powder; salt and sugar. Add grated orange rind. Cut in shortening until the mixture is like fine corn meal. Blend in the egg and the milk mixed together, then the orange marmalade and nut meats. Pour into a well-greased loaf pan about 10 by 5 by 3 1-2 inches and let stand 20 minutes. Bake in a moderate oven (350 degrees) 60 to 65 minutes.

Two egg yolks will thicken a cup of milk for a soft custard sauce to serve over fresh orange slices or other. Add a dash of salt and two tablespoons of sugar before cooking over hot water; when thickned and cooled add a quarter teaspoon of vanilla.

ANNANDALE FRUIT STUFFING
1 cup rice
1 bunch celery, cleaned and dried
1 large carrot, scraped and diced
2 cups cooked prunes, pitted and chopped
4 tart apples, pceled and chopped
2 cups fresh cranberries, chopped
1-4 cup sugar
2 teaspoons salt
2 eggs
Poultry or herb seasoning to taste

Boil rice; rinse under cold water. apples, add sugar and salt; cook with as little water as possible until carrots are tender. Drain add to rice and mix thoroughly; add chanberries. stir in eggs. Add more seasoning, if desired Make enough dressing for 14-16 pound goose or turkey. Ingredients should be hallved for use with pork loin or ducks.

This is an old New Jersey recipe especially good with goose, duck, or pork.

OLD FASHIONED STONE-GROUND CORN MEAL MUFFINS
1 whole egg
2 cups Hay Market Stone-ground meal
2 cups buttermilk
3 tablespoons melted shortening
1 teaspoon soda
1 teaspoon salt

Sift dry ingredients into mixing bowl, add milk and beaten egg, then shortening and stir well. Pour into si zing hot muffun rings and bake 20 to 25 minutes at 400 degrees F. For best results be sure to use lron muffin rings and stone-ground meal.

CHEESE-FRUIT SALAD

Allow 1 three-ounce package of cream chees to stand at room temperature to soften; then cream with 3 tablespoons mayonnaise. Cut 1 cup canned sweet cherries and 1-2 cup maraschino cherris in halves. Cut 1 cup membrane-free orange sections into thirds. Combine cheese mixture with fruit and 1 cup sliced walnuts and 1 cup drained crushed pineapple. Whip 1 cup whipping cream and fold into above mixture. Pour into custard cups and set in freezing compartment of refrigerator for about 3 hours, or until frozen. When salad is frozen remove from refrigerator and unmold by slipping a small knife around salad. Serve on salad greens.

Cookies cut into fancy shapes are fun for children. Spread filling on half the cookies and cover with the others to make "sandwiches." Prune, raisin, and fig fillings are especially good.

VOL. XXI. NASHVILLE, TENN., JANUARY 15, 1949 No. 12

Essay Gives 4-H. Youth Start In Successful Livestock Farming

Congressman Harold D. Cooley Praises Wake County 4-H Program

BY W. C. DAVENPORT
Nergo County Agent

Raleigh, N. C.—Wake County's Negro 4-H Club members were congratulated by Rep. Harold D. Cooley, Wednesday, Oct. 27, in an Achievement Day address at the Raleigh City Auditorium. More than 700 Wake Negro 4-H boys and girls, and 4-H leaders attended the meeting.

Praising the boys and girls for their efforts in building "a better community, county, state and nation," Mr. Cooley told them that "the meritorious cause in which 4-H Clubs are so vitally interested has a great future in this country."

"You have every right to advance and make further progress," he declared, "because this is your country and my country, and it will grow and prosper depending upon our progress."

Mr. Cooley was introduced by John W. Goodman, Assistant Director of the State College Extension Service.

In reviewing the accomoplishments of the county clubs during 1948, Philmore Williams of the Wendell 4-H Club reported that there are now fifteen active clubs in Wake County with a total membership of 783, including 410 boys and 373 girls. Of this number, 322 boys and 331 girls completed club prijects this year. Williams said 168 club members now have a total of $4,474 deposited in bank accounts, due to the profits from their projects.

The Rev. H. M. Ruffin, pastor of Shiloh Baptist Church, Beverlyville, Virginia, awarded project champion certificates and D. H. Keck, Assistant Cashier of the Mechanics and Farmers Bank awarded cash prizes.

Project champion certificates in corn went to: Mallie Edward Umphrey, Gordon Mitchel, Cecil Burnett, Chester Thomas, Robert Parham, Lonnie Adams, Moses Leak and Pattie Dozier. **Cotton:** Enouch Ferrell. **Tobacco:** Elvin Cozart, Lonnie J. Evans, Dewarner Moses, and Clifton McClain. **Peanut:** Warren Woodard and Edgar W. Hunter. **Sweet Potato:** Elmer Perry. **Poultry:** Doris Jones and William Barbee. **Calf:** Donald Lyons and James R. Adams. **Garden:** Frances McCullers, William Marshall, Shirley Stewart and Dafid Lee Rich. **Pig:** Thomas Williams, Alfonzo Mitchell, Hubert Mills, Henry W. Brown, William Herndon, Abner C. Umphrey and Sir Walter Scott. **Food Preparation:** Pattie McKey, Marie Mitchell, Rosa Bell Dozier, Gladys Marie Walden, Roxanna Kimble and Shirley Turner. **Food Preservation:** Mildred Evans, Shirley Umphrey, Ruth O. McGhee, Christine Perry, Elverda Bullock, Margell Smith and Pauline Pettiford. **Clothing:** Vinety Evans, Pauline Pennington, Doris Burnett, Emma Hinton, Margaret Hobbs, Edna J. Stewd, Juanita Hooper, Jane Delois Wilson, Edna R. Lawson, Mary L. Coffey, Naomi Chavis, Pauline Pulley and Elvera Lee Evans. **Room Improvement:** Marjorie Giles, Mary

Extension Director Symons Speaks At Community Fair In Maryland

Upper Marlboro, Md.—The highlights of the community fair at Asbury Church Hall, Saturday, Oct. 9, 1948, was the address of Dr. Thomas B. Symons, Director of Extension Service, State of Maryland. Dr. Symons emphasized the importance of learning to do better farming jobs through exhibiting the best products produced.

Farmers were urged to bring our more exhibits even to the extent of building a place to show it. It is a regretable fact, Said Dr. Symons, that we have more people than pigs in Southern Maryland. You should go all out in producing pork for your table and other livestock products.

Mr. William B. Carson, President of the County Commissioner urged the farmers to put greater emphasis on spiritual values and become more interested in civic and national affairs.

More than 400 exhibits of farm products were displayed by the farmers and their family.

The Local County Agent, Mr. James R. Taylor, gave a demonstration in the grading of tobacco. Demonstrations were also given in the saving of soil and home storage of vegetables.

Those receiving special prizes were: Mr. Lewis Brooks, 100 lbs. of pig meal for best stick of tobacco; Mr. Joseph Simms a set of sauce pans for best hand of tobacco; Mrs. Marion Hawkins, a set of sauce pans for best pic; Mrs. Ada Neale a frying pan for best dozen of eggs; Mr. and Mrs. Robert Burroughs a small roaster for best chicken; Mrs. Sarah Butler a floor mop and handle for best jar of tomatoes; Mrs. Roberta Neale a tea kettle for the best embroidery; Mrs. Wesley Hawkins a large canner for best jar of jelly; Mrs. Izetta Neale a food mill for best cake; Mr. James F. Washington coffee and mayonnaise for best white potatoes; Mrs. Cora L. Pinkney electric toaster for best bread; Mr. James Swann large roaster for best turkey; Mr. and Mrs. William Lee coffee pot and dish pan for best sweet potatoes; and Mr. Henry Butler $5.00 in merchandise for best corn.

Mr. Martin G. Bailey, Milbourne Hull, Russell Gaines, and C. M. Whitley served as judges.

4-H'er Wins Pig with Essay

Clinton Mooring, Texas 4-H boy, shows off his champion Poland China sow and her pigs to State Extension Leader W. C. David, right, and Charles E. Trout, left, who recently returned from Liberia where he established an agricultural extension program. Clinton won this sow nearly three years ago at a Texas district fair with an essay he had written on farm life. A year later this sow was acclaimed champion at a similar fair and the youth was awarded 150 White Leghorn baby chicks and registered Jersey heifer. After college, Clinton plans to be a livestock farmer.

Clinton Mooring Of Lone Star State Sets Enviable Record

Washington, D. C.—With an essay he won a pig, and with the pig he won a calf and 150 chickens. That's how Clinton Mooring, Texas colored 4-H boy, has got his start in livestock farming.

It all started four years ago when Clinton, who did not have a pig or a calf to take to the district fair, decided to enter an essay he had written on farm life. The essay won him a purebred Poland China pig which he took home to raise. Clinton was careful to keep his pig well fed, properly housed, and well groomed. The next year his gilt won the district championship and with it 150 White Leghorn baby chickens and a registered Jersey heifer which now has a calf.

With egg money from his Leghorns, Clinton bought 25 baby turkeys the next year, raised and sold them Last year he increased his turkey flock to 50, and this year to 100.

During the last two years, Clinton's gilt has farrowed 37 pigs. Eight of these he has given to other 4-H'ers in the community for brood stock to help improve the quality of hogs in the country, 24 of his pigs he has sold, and the rest he is raising for market.

In totaling up his gross income from projects last year, young Mooring shows in his record $200 from eggs, $235 from turkeys, and $208 for pigs. After taking out feed expenses which he owed his father and money for a bicycle, Clinton added the rest to his money for college.

The 15-year-old youth, who is in the 10th grade, plans to study agriculture at Prairie View A. & M. College after graduating from high school. "I want to learn to be a real livestock farmer," says Clinton. "Then I want to come back here and help my father develop and enlarge his 165 acre farm."

The Moorings bought their farm for $3,000 in 1940 after being ten-

Annual Meeting of Negro Agricultural Extension Workers Held Nov. 18-20

The annual meeting of Negro Agricultural Extension Workers was held Nov. 18-20, 1948, at the Baptist Sunday School Publishing Board.

The Annual Meeting was certainly a good one with a program of information that the agents can now begin to form their 1949 calendar of work and be ready for the new year. The program provided for the presentation of the Director, Vice Director and Assistant Director, District Agents and Specialists.

Director McLeody discussed: Extension Policies, and emphasized the need of agents studying their jobs. He stated that the changing times presented a necessity for the change in the method of doing the Extension job. "Its impossible to do today the way we did yesterday, and expect to be employed tomorrow." He praised the representatives and 4-H Club members for the report that he received in Washington on their activities at the National Camp.

Vice Director Moore stressed the fact, that we are to educate the people whom we work with, spiritually, physically, socially and economically. If we fail here, then we are not carrying out the polities of the Extension work.

The National Agricultural Program was effectively discussed by Mr. James L. Anderson and Miss Lillian Keller. This information was prepared in a manner that was appreciated, usable and enjoyable. Mr. Anderson, Extension Economist, dealt with the farm prices and outlook, and Miss Keller, Home

Robertson Youth Wins Corn Production Contest

Gene Jernigan, outstanding Future Farmers of Ameriea member from Robertson County, has been deelared winner of the Tennessee State Fair eorn produetion contest, it was announeed today.

With an unpreeedented yield of 196.3 bushels from a single acre, young Jernigan nosed out his neares eompetitor, Leroy Bosley, Negro 4-H Club member in Montgomery County, by some 43 bushels Bosley got 153.5 bushels.

Third was Grady Carpenter of Moseow with 148 bushels and fourth place went to Riehard Leath of Somerville with 144 bushels. Other winners were S. C. Blair of Slayden, fifth; Jimmy Holmes of Springfield, sixth; and George Sherrill of Hillsboro in Coffee County, seventh.

First prize was $100, second $75, third $50 and fourth $40.

Sponsored this year for the first time, the eorn production contest will be made a feature part of the State Fair program, aeeording to Judge Litton Hoekman, chairman of the board. The eontest was under the supervision of Osear Farris, agrieultural agent for Dividson County and superintendent of the agrieultural division of the State Fair.

"We will continue this program and will make it bigger and better eaeh year," Judge Hickman said.

Farris explained that the contest was started to emphasize the importanee of approved practices in the farm program and "these outstanding yields are proof that many farmers are fooling themselves in their methods of eorn produetion."

More than 100 entered the contest and 60 eomplied with all regulations and eompleted reports. One requirement was that each contestant must exhibit stalks from the field at the fair. This provided one of the most fundamental and edueational exhibits there.

The eontest had the support of the Tennessee Crop Improvement Association.

Jernigan's Program

The 196.3 yield, whieh is more than six times the state average of 30 bushels, was produeed from Tennessee No. 10 hybrid seed, on Baxter type soil. The crop was planted in rows 35 inehes apart, allowing for 11 inches between stalks.

Prior to planting, young Jernigan plowed under 1,000 pounds of tobaeeo stalks and 10 tons of barnyard manure. At planting time, he applied 1,000 pounds of 3-9-6 fertilizer in the row. This was followed by four shallow eultivations and the weeds were ehopped out at onee.

In figuring net ineome from the plot, Jernigan allowed $15 for tractor and labor eosts, $30 for manure and $44.50 for other fertilizers and tobacco stalks, making a total eost of $89.50. The eorn, vauled at the present government loan rate in Robertson County, is worth $306, leaving a net ineome of a little more than $216.

Jernigan completed four years of 4-4 Club work and two years of FFA aetivities and is now a student at the University of Tennessee Junior College in Martin.

Bosley's Reeord

Working under the supervision of J. R. Branham, assistant eounty agent in eharge of Negro aetivities in Montgomery County, Bosley used less fertilizer, but followed the same method cultivation.

The young Negro planted Tennessee yellow hybrid No. 602, which will be available for commereial use next year and which was provided for this projeet by the Tennessee Crop Improvement Assoeiation. He applied 150 pounds of 3-9-6 fertilizer at planting time and 200 pounds of nitrate of soda as a side dressing when the corn was less than knee high. He plowed the crop four times with a shallow cultivator.

All of the winners produces more than 100 bushels per aere and five of them planted their crops during the third week in May. With exeeption of Bosley, more than an average application of fertilizer was made in eaeh ease. However, Bosley did use nitrate of soda. All crops were produced from hybrid seed and no deep cultivation was made.

Burley Opening Sales Show Higher Averages Than 1947

The new sales season opened throughout the burley tobaceo belt yesterday and reports from Middle Tennessee markets showed price averages above those of opening day of last year.

Every midstate burley center realized an increase in average price a hundredweight.

Largest total in sales was recorded at Gallatin where 438,340 pounds were moved; highest average was the $53.05 at Hartsville; Clarksville led in high basket sale with a $68 mark, and Gallatin was high in total money with $230,723-.08.

The quality of the leaf was said to be generally better, although somewhat lighter than that of last year. The increase in federal support priees of $2.10 a hundredweight has led most warehousemen to predict a financially successful season which may equal or surpass last year when sales averaged $48.30 for the hundred-pound baskets.

Top baskets on Middle Tennessee floors yesterday sold at $63 up through $68.

Sparta had what was termed a "good day" as the first floor in White county history was opened. Maury county's first sale was held at Columbia, switching to Mount Pleasant.

Sales on midstate markets:

Clarksville— Total pounds 329,-724,, bringing $158,774.45. Average sale was $48.15 as compared to last year's $41.65. Top sale $68.

Gallatin— Total pounds 438,340, bringing $230,723.08. Average $50-.51; last year, $48.28. Top price $63.

Hartsville— Total pounds 375,-782, bringing $199,336.97. Average $53.05; last year, $51.07. Top price $655.

Sparta— Total pounds 136,244; bringing $67,214. Average $48.92. Top price $63.

Columbia—Total pounds 415,012, bringing $209,732.03. Average $50-.53; last year, $45.92. Top price $66.

Fayettevillc—Total pounds 318,-442, bringing $166,213.49. Average $52.20; last year, $49.15. Top price $64.

Springfield—Total pounds 201,-192, bringing $91,817.94. Average $45.64; last year, $44. Top price $63.

Carthage—Total pounds 356,118, bringing $188,340.40. Average $52-.89; last year, $52. Top price $63.

Franklin—Total pounds 347,588, bringing $178,155.20. Average $51-.25; last year, $49.46. Top price $65.

In Kentueky, Hopkinsville reported total sales of 435,960 pounds for $215,258.84. Average was $49.37 as compared to $42.88. Top priee.

Bowlink Green sold 385,326 pounds for $189,123.03 an average of $49.06. Last year's average on opening day was $45.67.

When Is Mule 'Deef' or Just Hard-Headed?

Atlanta, Nov. 30—(AP)—When is a mule "deef or just plain hard-headed?"

Fulton Superior Court Judge Ralph McClelland ruled it was "deef" if it didn't stop on "whoa" at the end of a furrow.

The ease eame to eourt after A. T. Vaughn eharged John Fowler with fraud for selling him a deaf mule for $35. Fowler said the mule was just hard-headed.

Vaughn said he plowed the mule a couple of furrows and noticed it wouldn't stop until Fowler flagged it down.

Judge McClelland ordered Fowler to give Vaughn his money back.

Fowler said he didn't mind. He'd already sold the mule again —for $35.

Farm Talk with Farm Folk

By JESSE SAFLEY

Farmers in general don't take enough interest in matters having a direet bearing on their business. They devote all their time and money to producing erops, produce and livestock, yet they seem uneonecrned about factors affecting the marketing of these produets.

This was shown recently when only a small percentage of the milk producers in this area were present at the annual meeting of the Nashville Dairy Council, Edueational organization of the dairy industry, the eouncil is financed by producers, distributors and ice cream manufacturers to influenec the sale of more milk and milk products.

Organized only four years ago, the couneil has already brought about an increase in the eonsumption of milk by the average individual and has gone into every sehool in this area through its health education program. If all of the 700 producers had been present at the meeting and had heard the program presented by school boys and girls, they would have been convineed of the big role they are playing in Middle Tennessee.

It's hard for anyone, especially farmers, to appreeiate the value of an investment without knowing in what way it is being used to help his business. Therefore, it would be to their advantage to take time out now and then and find out about what is being done and to lend moral support to those doing the work.

State agrieultural experiment stations are making great contributions to farming in Tennessee. Their findings are in one way or another influencing most every farm program in the state. However, it is believed that more good could be done if the results of their experiments were expedited to the farmer.

It is understandable why those in charge must be sure of a fact before plaeing their seal of approval on it, but why is it necessary to wait, so long before issuing data that will be issued without recommendation anyway?

We have referenee to the data distributed at a reeent agricultural meeting giving yields of various small grain crops in 1948. This material was labeled "preliminary unpublished."

Wouldn't it have been just as well for that information to have reached the farmer soon enough for them to know the yields of various varities before seeding time this fell? There isn't ony sound reason for waiting a whole year to get variety yields on erops sueh as wheat, oats and rye.

We would never suggest that recommendations be made prematurely, but facts are facts and there could be no harm done in letting the working farmer know about them. If experiments prove that this variety of oats outyielded that variety in 1948, why eouldn't the farmer have this information in 1948 instead of receiving it at a field day in 1949? A erop year has passed in the intervening time.

Lost time is never regained.

The Store and the Community

The primary funetion of a retail store is to provide a place where people may buy their food and clothes and hardware and all the rest of the necessities and luxuries of life. The merchant is purehasing agent for the eansumer.

Beyond that, retailing serves a highly important and often overlooked funetion. It is one of the great builders of the community. The stores all compete to attract business—but they pull solidly together in matters that affect civic progress and the ereation of a better town. This is good business for them—and good business for every one else too.

Every time a new residential development is opened the stores come in and establish attractive shopping centers. There are chains and independents. That makes for greater eonvenienee for the buyer. And, in addition, it makes for the best possible serviee, stoeks of goods, and the lowest possible prices. If the consumer isn't satisfied with his loeal merehant, he ean drive a few miles to another community and spend his money there.

The retail merehant is the foundation of American eommunity life.

CHOICE WORSHIP SERVICES AND PLAYS

A book that fits in with the urgent needs of the present day. Written by various authors familiar with church requirements. Among its contents are several choralogues: The Woman at the Well; The Nativity; The Prodigal Son; etc. Tribute to the Rural Church is a beautiful tableau. The Little Church of Childhood is a plea for the continuance of the rural church. The Melting Pot is a patriotic number climaxing with the church's contribution to the country. Others are for Lord's Day observance and general occasions. A valuable book. 40c.

PLANS AND PROGRAM BOOK

Here is a collection that will provide an abundance of program material to those entrusted with the responsibility of preparing suitable programs for socials, Sunday School entertainment, Young People's Societies, etc. It is a book for many occasions and contains 142 pages

Prepackaging Fruits and Vegetables by Cooperatives

BY OSCAR R. LeBEAU

Agricultural Economist

The rapid growth of self-service stores during recent years has caused the fruit and vegetable industry to give increased attention to prepackaging fresh produce in consumer-size units.

Giant super markets have made it possible for busy housewives to select quickly most of their groceries from a wide array of prepackaged, pre-weighed, and prepriced items. The chief exception or bottlenecks to this speed-up in handling have been fresh fruits and vegetables and meats.

Quite naturally, growers and shipper cooperatives in the fruit and vegetable field are interested in seeing the fresh produce departments of the super markets grow and prosper. Making use of modern marketing developments such as prepackaging is one of the most promising means for maintaining satisfactory outlets and opening up new ones for their products.

At present two methods of prepackaging are used—the first, to cut, trim, and package right at the shipping point, and the other, to do the prepackaging job at the terminal market. In either case, the product goes to the retail store and on to the consumer in handy-sized and attractive packages. The product in the consumer-size containers has been trimmed of waste, cleansed in most cases, and is practically ready for table use.

Prepackaging made its greatest growth just before and after World War II. Shortages in labor and container supplies hindered its development during this war. Most of the growth that did occur during the period came in the citrus industry, which put much more of its fruit in mesh bags.

Potatoes, apples, grapes, and blueberries were the principal fruit and vegetable items prepackaged by cooperatives before 1935. Among the earliest firms to market potatoes in consumer-size bags was the Michigan Potato Growers Exchange, Cadillac, Mich. It began this back in 1927. By 1947, this cooperative marketed 47 percent of its potatoes in 15-pound double walled paper bags.

NOTE: Grateful acknowledgment is extended the cooperatives for providing information upon which this report is based; to M. C. Gay and J. H. Heckman, Cooperative Research and Service Division, Farm Credit Administration, for their assistance in planning the study; and to Weldon Walker, Cooperative Research and Service Division, Farm Credit Administration for tabulating the data.

Among the first apple associations to experiment with prepackaging were the Inwood Fruit Growers Association of Inwood, W. Va., and the Apple Capital Association of Wenatchee, Wash., the former beginning in 1926 and the latter in 1928. Both of these discontinued prepackaging after a trial period.

Departing from conventional packaging methods brings many problems and disappointments to prepackagers. For this reason the Farm Credit Administration has made a study of recent activities and experiences of leading farmer cooperatives that have been prepackaging. This is a project under the Research and Marketing Act of 1946 and part of a larger study, "Minimizing Waste and Increasing the Salability with New Processing and Packaging Technique."

Since the problems of cooperative groups are representative of those of the fruit and vegetable industry as a whole, the study should be of industry-wide benefit.

Procedure Used

In conducting this survey, the Farm Credit Administration sent a letter and questionnaire to approximately 230 fruit and vegetable cooperatives throughout the United States about March 1, 1948. The list was gleaned from more than 900 grower cooperatives, FCA omitted small associations and those it knew were not prepackaging from the original mailing list. Also where a group of cooperatives were members of a marketing organization it contacted only the central office.

The initial 11-question schedule—sample attached at end of this report—was mailed to this selected group of cooperatives. A follow-up letter and duplicate schedule were sent to those who had not replied by the end of 4 weeks.

Altogether, replies were received from 149 associations or from 65 percent of the 230 canvassed.

Present Status of Prepackaging

The replies showed that by March 1948, 44 cooperatives or 30 percent of those responding had some experience in prepackaging at the shipping point. Citrus, white potato, and apple associations led the list, accounting for 10 percent of those having prepackaging experience.

Other commodities handled in smaller quantities and shown in table 1 under heading "other" were celery, cranberries, onions, blueberries, grapes, dried peas, plums, rhubarb, and tomatoes.

About one-third of the fruit and vegetable cooperatives that reported prepackaging initiated the practice during the 2 postwar years, 1946 and 1947. Among the commodities represented in this latest expansion were apples, citrus, plums, rhubarb, dried peas, tomatoes, and white potatoes. The stepped-up progress of the last 2 years indicates that prepackaging has gained increased recognition among producers and shippers.

Not all of the associations undertaking prepackaging have found it profitable. Sixteen percent of the fruit and vegetable cooperatives that reported experience in prepackaging had discontinued the practice at the time of the survey. Apple and celery organizations accounted for the largest number of discontinuances.

The most frequently listed cause for abandoning prepackaging was cost. Several associations reported that the prices obtained for the consumersize packages were insufficient to compensate for the additional container and labor costs incurred. This is obviously one of the largest hurdles to be overcome.

The next most important cause for discontinuing prepackaging concerned the keeping qualities of the commodities so handled. Some had difficulty in getting their commodities marketed in fresh and crisp form. Others found it necessary to repack the produce at the destination to remove damaged items. Some cooperatives had difficulty in finding a container that would hold up in storage. Others found it hard to handle consumer-size packages with their regular carlot business or to follow through with year-round sales.

Several reported that their prepackaging efforts had been premature when tried 10 years ago. Some of these expect to try it again under more favorable circumstances.

Of the 110 cooperatives not engaged in prepackaging in 1947 that replied to the questionnaire, 20 indicated their plans for the next 2 years. Seven of these were planning to undertake prepackaging soon. An equal number reported that they were disinterested and 6 were undecided. Included in the affirmative group were several who were planning to reenter the packaging field. For example, one vegetable cooperative reported "We intend to experiment again with cauliflower. We believe it a good product to prepackage due to so much waste in the present method of shipment." Among the cooperatives that were planning to prepackage for the first time were those packing apples, grapes, peaches, and spinach.

The associations which expressed themselves as disinterested in prepackaging mentioned the increased expense and labor involved. One added, "Our sales office advises against prepackaging until more research has been done."

Typical of the responses of those undecided was that of the managers who said: "If and when it appears to our advantage to prepackage we will make the change; at present it is of no advantage to us."

Several associations now prepackaging volunteered that they were planning to expand their packing and storage facilities and to add new commodities. One of these commented: "We have 12 years' experience and we certainly have no intention of quitting now."

Proportion of Commodities Prepackaged

Most of the cooperatives that prepackaged in 1947 handled only a part of their sales in consumer-size containers. Some were pursuing the matter more or less experimentally to keep abreast of competition. Others had been prepackaging for some time and were gradually expanding their output. Table 2 summarizes their replies on this point.

Apples—Three-fourths of the associations prepackaging apples in 1947 handled less than 10 percent of their sales in this manner. Two New England associations packed 15 percent and 20 percent respectively in consumer-size packages. These led the list percentagewise.

Citrus — Selling oranges and grapefruit in small mesh bags represented one of the most active fields of prepackaging in 1947. This was particularly true with the Florida and Texas citrus associations. Five-eighths of the cooperatives prepackaging oranges handled from 20 to 40 percent of their sales in this manner. One large citrus exchange, for example, packed 37 percent of its oranges and 11 percent of its grapefruit in small mesh bags. It sold the majority of these without the use of a master container, or an outer box holding 8 or 10 bags. A leading lime association packed 28 percent of its 1947 sales in cellophane covered trays.

White Potatoes — Potatoes led the list of major commodities in the number of cooperatives that prepackaged 40 percent or better of their sales. Two northeastern cooperatives reported selling more than 80 percent of their 1947 volume in 10 and 15-pound paper bags.

Onions—Prepackaging onions at the shipping point is still negligible as evidenced by the fact that none of the cooperatives replying sold more than 2 percent of their 1947 volume in 10-pound mesh bags.

Cranberries—One large cranberry exchange prepackaged 40 percent while another prepackaged 10 percent of its 1947 crop. The trend toward 16-ounce consumer bags is definitely upward for this commodity.

Other—One grape association and a leading blueberry association each reported prepackaging better than 80 percent of its sales in 1947.

Amount And Type of Equipment Used

Most of the prepackaging attempted by cooperatives to date has been done without the aid of additional equipment.

Roosevelt Newkirk Awarded Prize

Fayetteville, N. C., (Special)—When the 4-H Club members of Pender County attended the state meeting in this city representing the southern district, none claimed more attention and made a greater record than Roosevelt Newkirk, who represented the 4-H Club from his county. His training, his intelligence and his exhibit of what he had been able to do, won for him the award from the judges who considered every contestant from every angle.

There was great rejoicing when Roosevelt was announced the winner. The county agent for Negroes in this section, Mr. C. W. Wiggins, made the announcement about the award, and he said that the people specialize in hybird corn and pasture demonstrations under his supervision.

"Those who believe that any labor legislation substituted for the Taft-Hartley Act must serve and protect the interests of the public still have very strong representation in Congress. In the new Senate there will be 55 members who favored the 1947 legislation; in the House there are 226 Representatives who voted for the measure or were regarded as favoring it."—The New York Times.

Most Southern Gardens Need Fall Fertilizing

By DR. FLOYD BRALLIER,

Garden Editor,
The Nashville Tennessean

Perhaps there is not one garden in a hundred in the South, whose soil is in first-class condition.

Most of these gardens need fertilizing very heavily every year, with some material that will not only supply fertilizing elements, but an abundance of humus. Fall is the best time to do this fertilizing if we are using any kind of organic fertilizer, and no matter what kind of chemical fertilizer your soil needs, it also needs an abundance of humus-forming fertilizer. We are not opposed to the use of commercial fertilizer when it is needed, but no amount of commercial fertilizer will restore the needed humus to the soil, and without this humus the soil will never be in first-class condition.

Manure Is Best

The best of all fertilizers for fall use of land that is not already planted, is manure from the horse barn. The fresher it is, the better it is. Fresh manure from the horse stable, especially if the horses have been bedded moderately with straw, contains more fertilizing elements than any other standard animal fertilizer. But it must not be used in this form in the spring, for it contains too much easy-soluble material and so may "burn" the plants. It is safe, however, to spread it over the surface of the soil, to a depth of two or three inches in the fall. And it should be spaded or plowed under as soon as it is applied, certainly within three or four days. For if it is left lying, exposed to the open air, much of its most valuable nitrogen will be lost by evaporation.

If a good coat of stable manure of any kind is turned under to a depth of at least 5 or 6 inches, it will disintegrate before spring, and penetrate all the surrounding soil. Handled in this way, the soil will be made thoroughly rich, but there will be no danger of its injuring anything that is planted on it. We wish to emphasize the fact, however, that the use of fresh manure from the horse stable should always be done in the fall, though it is all right to market a light application in the spring.

Tests Show Loss

We hear much about not using manure until it is two or three years old. Animal manure, the best form of fertilizer, has become so scarce and hard to get, that we canot afford to keep it two or three years before using.

Experiments show, that a ton of fresh manure, placed where it will decay readily and rapidly, for a year, will lose about 2-5 of its weight and a little more than 1-10 of its fertilizing value. If it was stored in the open air where it will catch all the rainfall of the year, the loss will be somewhat greater than this. A ton of this one-year old manure will contain a little more fertilize than will a ton of fresh manure, but it would require at least a ton and a half of fresh manure to make a ton of this one-year old manure.

In other words, by not using our manure fresh, we lose nearly one-fourth of its fertilizing value. This old manure can be used freely without danger of "burning" the plants again though we would repeat "can we afford to waste good fertilizer in this way"

Cow Manure Second

Second in value to manure from the horse stable, is manure from the cow stable. Cow manure is especially valuable if it comes from a dairy barn where the cows have been fed plenty of concentrates Cow manure has one advantage over that from the horse barn, it can be used at any time of the year, for it does not burn the plant, unless it is used very freely indeed. Another advantage is, that it takes much less time to turn into humus, but as we have already stated, a ton of cow manure does not contain as much actual fertilizer, neither does it make as much humus as does a ton of fresh horse manure.

Next in value, in the line of animal fertilizer, is sheep and goat manure. They are the least trouble to use of any. They make plenty of humus, but are not quite as high in actual fertilizing value as either of the two previously mentioned. They can be obtained anywhere and they are prepared and ready for use. The large, packing houses save all their accumulated sheep and goat manure, and dry and heat it enough to kill all weed seed and then grind it to powder and put it in 100 lb. bags. Most fertilizer dealers handle it regularly.

Shredded cow manure is prepared by the slaughter houses in the same way, but it is so easy to obtain fresh cow manure in much of our country, that it is sold mostly in those locations where they cannot get any. These prepared fertilizers have no odor, have good fertilizing value and will not burn plants, however, we recmmend their use only in spring and summer.

Not Widely Used

Hog manure is not widely used because of its unpleasant odor and the common opinion that it is not good. The facts are, that it is fully equal to com manure, but because hogs are fed corn on the ear, it is almost impossible to get any large quantity of hog manure without its being mixed with corn-cobs. This is no disadvantage for fall use, if it is turned under the depth of 6 or 8 inches, for such corn cobs decay readily in the ground, and they not only give plenty of humus, but they are reasonably high in actual fertilizing materials.

We are asked very often about using fertilizer from the poultry house and from rabbits. Poultry manure is probably the richest in actual fertilizing value than any of the other animals manure you are apt to get, but it is also very soluble, so it must be used with extreme care. If used at the rate of one pound of poultry manure instead of four pounds of horse manure, you will get about the same fertilizing value without injuring your plant. While not as rich as poultry manure, rabbit manure is very high in fertilizing value, and it can be used without much danger of its injuring the plants. Both poultry manure and rabbit manure can be used at any time, if used cautionusly.

Farmers Urged to Spend Wisely

WASHINGTON —(AP)— The National Planning association said yesterday farmers could help national prosperity by spending their boom-time profits on better homes, equipment, clothing, education and medical care.

Improvements are needed in American farm living, said a report issued by the association's agriculture committee. It advised against buying new land at inflated prices.

"For a large part of the farm population at the present time, there is no longer the excuse of low income for not providing houses and home conveniences for their families on a par with town and city homes," the report said.

The association said farm spending for better living would have a beneficial effect on the whole economy. It would help maintain full employment in the cities, the report added. In turn, such employment would help keep a good market for farm products.

The association is a non-profit, non-political private organization devoted to planning in agriculture, business, labor and the professions. The report was prepared by Lowry Nelson, professor of sociology at the University of Minnesota.

It was approved by the association's agriculture committee, which includes 25 farm leaders from all parts of the country.

The report said farmers are prosperous now as never before. But their prosperity was said to be still so new that it is not yet reflected fully in their standard of living.

As to buying more land, the association said:

"If the farmer runs up his own costs by buying more land at inflated prices, he becomes more vunerable when the next price drop comes. At the same time, from the national point of view, he is contributing to the boom now and making the bust worse when it comes."

Mr. Dave Smith

(Continued from page 1)

and the owner of these slaves who tilled the soil was proud of his farm. Grandfather Smith finally passed away, and his son took his place in tilling this soil, but emancipation had scarcely been lifted. This was during the days of reconstruction. The grandfather, his wife and children tilled the soil, his son came on with his wife and children and they followed suit, but they were tenants; they had not been able to save enough money to buy this rich land.

There was shifting changes here in the agricultural section of Louisiana, more rapidly here in the middle part of the state than down near the gulf coast. Eventually this son passed away, but the grandson came on the scene. He was a natural born farmer, he represented three generations that knew this soil, whose only inclination was a "Back to earth" idea. He bought the farm, so now he is operating it extensively.

It is said here that this is one of the few instances where a grandson owns the land, tills the soil, operates a great farm and holds title to these extensive holdings that were once worked by his grandfather who was a slave, and who in his fondest dreams, did not feel that any of his children or grandchildren would be so fortunate.

Mr. Smith is a regular reader of the Modern Farmer, and rejoices in the fact that the farmers of the nation have a newspaper of their own which can bring many interesting stories about what the grandchildren of slaves are able to do in those states where so many of the younger ones feel that there is no future for them.

Joe Louis Adams

trict with a large attendance of 4-H Club members and leaders.

Also attending the exhibition from Wake County were Thornie Holden, 4-H Club Leader of the Fletchers Grove Community, and W. C. Davenport, Negro County Agent of the State College Extension Service.

Annual Meeting

(Continued from page 1)

Management Specialist, stressed family planning. It was a good demonstration indeed.

Mr. George Foster, Assistant 4-H Club Specialist, was emphatically impressive as he held his audience in his discussion on the use of 4-H leaders and the improvement of 4-H contest stories. Mr. Foster was perfcet in his comparison when he said that our Christ did not try to contact every individual. He used his 12 Disciples, eleven of whom worked, and there were results. He stressed the need of contaeting and training leaders in the Extension work to help get the message to all the people. This was a challenge to all workers in getting more leaders to carry the message to more people, therein reaping better results.

The Workshop Study was very well done on Friday morning on Community Planning, Family Food Supply, Developing a Sound System of Farming and Improving the Appearance of the Home and Farm. The following Home and Farm Agents worked untiringly in bringing in data on their special topics: Misses K. Gresham, L. Epps, M. E. Woods, R. Edmonson, C. Edwards M. Harlan, M. Henry, G. Williams, E. Person, A. Jackson, M. Moore, Mrs. Cottrell; Messrs. A. M. Dobbins, J. R. Branham, G. A. Newbern, M. Sloan, M. Maxwell, E. R. Shockley, W. T. Bernard, G. W. Senter, C. D. Haley, F. E. Jeffries, C. Koonce, and Mr. Ernest Brazzle, Negro 4-H Club Agent. These agents have asked for a workship of longer duration.

Mr. J. W. Mitchell, Field Agent, discussed the progress of the Extension Work in the upper region of the Southern States, with special stress on Tennessee's progress.

Miss Aubry Scott, Assistant 4-H Club Specialist, discussed on Friday and Saturday, How to Develop a Good 4-H Program and Rules and Regulations for the Contests. Changes were made and suggestions given for the improvement of all contests.

Miss Bessie L. Walton, Assistant State Agent in Negro Home Dem. Work, presented the second method of studying ones jobs:—by the Evaluation Method. Four counties were selected by Random Sampling last year, and they have made a study of the project: "Lighting Rural Homes for Negroes." These four counties; Haywood, Crockett, Giles, and Wilson, known definitely the number of homes with lights, with fixtures and etc. Then it will be known what to stress in next year's program.

Mr. Ronald Slayton, Craft Specialist for the Extension Service, exhibited some articles in craft and also diseussed the program as planned for March of 1949.

The Home Agents in their separate session were presented with the neecssary things to stress in the Program of Work for 1949. Miss Jacobs, District Agent, West Tennessee, emphasized the need of more result demonstrations, and more meetings at these demonstrations. She listed the projeet, training meetings and agents meetings for the year.

In the Men's Separate Session, presided over by Mr. W. H. Williamson, Assistant State Agent in Negro Work, the men discussed at length how to improve 4-H projeets: conducting the project, completing the record; more definite plans, more responsibility to leaders and closer checks by agents.

Mr. Slayton, Craft Specialist, also discussed handicraft and made plans for demonstrations to agents.

Mr. H. W. Wellhausen and Mr. Bruce Hateher of the Department of Agronomy, Extension Service, diseussed and showed pictures on Hybrid corn, whieh is grown by 40 per cent of Tennessee farmers because of the increased yielding ability.

Many questions were asked by agents and many recommendations given by the specialists.

The agents departed with fresh information, determination and impatience to begin anew.

Congressman Harold D. Cooley

(Continued from page 1)

Horton, and Joyce Burton. **Garden:** Shirley Mitchell and Luvenia Cobb. **Poultry:** Lola Leslie. **Crafts:** Mel Rose Perry.

First prizes of $6.50 for dairy show exhibits went to J. R. Adams, Council Scott and Robert Pretty. Second prizes of $5.25 went to Chas. Dunn and Fennell Pretty.

Four-H Thrift Club prizes were awarded to the club having the largest percentage of its members with bank accounts. Fifteen dollars in prizes were put up by the Mechanics and Farmers Bank. These prizes were awarded as follows: 1st prize of $8.00, Holly Springs 4:H Club; 2nd prize of $4.00 Juniper Level 4-H Club and 3rd prize of $3.00, Jefferies Grove 4:H Club.

For curtain exhibits at the State Fair, 1st prize of $10.00 went to Mary Mason. Five dollars each also went to Mitzie Walden and Esther Biles.

Leadership Certificates were awarded to the following county teachers and adult community leaders: **Teachers:** Mrs. Pattie Smith Pleasant Union; Mrs. Cornelia Haywood , Pine View; W. E. Hunt, Holly Springs; W. T. Wilson, New Hill; R. L. Yokley, Apex; Mrs. Elizabeth Williams, Apex; Mrs. Alma Williams, Apex; Mr. Bessie Blue, Apex; Mrs. E. H. Holt, Cary; Mrs. Estelle Smith, Jefferies Grove; James Watkins, Sandy Fork; Mrs. Beulah Glover, Riley Hill; Mrs. J. H. Cobb; Riley Hill; Mrs. Frances Massenburg, Hiley Hill; Mrs. Alma L. Harrison Wendell; Mrs. Zack Ellis, Wendell; Leroy Burton, Fuquay Springs; Hester Anner Jones, Springfield; Mrs. Johnsie Sherman, Springfield, Ms. Pearl McDonald, Juniper Level; Mrs. Margaret Adams, Juniper Level; and Ruby Sanders, Holly Springs. **Community** R. B. Raiford and Mrs. Dorothy Alston, Sandy Fork; Theo Hodge and Mrs. Erma Dunn, Riley Hill; Waymond Morgan and Mrs. Cremo Ferrell, Wendell; Millard Perry and Mrs. Gertrude Goodson, Eagle Rock; Bartel Lane and Mrs. Odessa Lane, Springfield; Mrs. Sarah Jones, Cary; Ernest Booker and Mrs. Emma L. Womble, Holly Springs; Mrs. Luch Rochelle, Apex; J. M. Burroughs and Mrs. Mattie Barbee, Shiloh; Thornie Holden and Mrs. Ophelia Leathers, Fletchers Grove; and J. R. Adams, Sr., Juniper Level.

Harold Cotton, Apex 4-H Club, presided over the program. Others taking part on the program were Betty Peebles, Ernest Lee Cradle, Sarah Moore, Herman Latta, Delois Wilson, Mary Alice Hester, 4-H Club Secretaries, 4-H Thrift Skit, Holly Springs 4-H Club; and Geneva Johnson. The welcome address was given by T. Floyd Adams, Wake County Commissioner.

Martha Ruth Cannady, Garner 4-H Club, represented the county 4-H Clubs in presenting Rep. Cooley with a gavel at the end of the program.

Visitors seen at the occasion were Dr. R. P. Daniel, President of Shaw University; Rev. O. S. Bullock, pastor of the First Baptist Church, Raleigh; Rev. G. E. Cheek and Rev. S. F. Daly, Shaw University; N. A. Pitts, Head of Soeiology Department, Shaw University; C. A. Marriott, Principal of Garner High School; Emory Johnson, prineipal of Berry O'Kelly High School, Method; E. L. Raiford, Exeeutive Secretary of the Bloodworth Street YMCA; A. J. Turner, owner of Turner's Florist; L. R. Harrill, State 4-H Club Leader; R. E. Jones Negro State Agent; J. A. Spaulding Negro District Agent; J. C. Hubbard, Negro County Agent, Durham; Ernest Goodrum, Negro County Agent, Rich Square; Miss A. N. Rich, Negro Home Agent, Rich Square; B. B. Gaillard, Negro County Agent, Fayetteville; E. P. Thompson, Assistant Negro County Agent, Lumberton. Veteran teacher of Wake County was also in attendance.

Mountain Guide: "Don't go too near the edge of that preeipice; it's dangerous. But if you do fall, remember to look to the left, you'll get a wonderful view."

Dairy Farmers Urged to Lead Fight on Oleo

"Dairy farmers of Tennessee should take the lead in urging an outright ban on the commercial limitation of butter instead of taxes on oleo," Mrs. J. Loring Taylor of Washington, recently told the Nashville Milk Producers.

Mrs. Taylor, who is edueational directer of the National Cooperatives Milk Producers' Federation, addressed the meeting of the board of directors of the Nashville Milk Producers, Inc., and their guests at the Chamber of Commerce Building. Her remarks supported the new policy of three of the nation's largest dairy organizations, which propose to remove all taxes and license fee on the butter substitute.

Dairymen seek imposition of a flat ban on the imitation of butter through the commercial manufaeture and sale of oleomargarine colored yellow in imitation or semblance of butter.

Mrs. Taylor pointed out that this "commercial yellow" ban would permit housewives to obtain all the oleomargarine they want for home use in its most economieal uncolored form, without payment of any taxes whatever.

The new proposal would abolish all fees and reporting requirements for oleo retailers, wholesale and manufacturers, Mrs. Taylor said, and permit hospitals and other institutions to serve uncolored oleo without license or tax. At the same time, she declared, the ban would effectively curb fradulent and deceptive efforts to deprive the nation's dairy industry of its vital butter market.

The new dairy policy is in keeping with the traditional two-fold aims of the dairy industry in supporting oleo legislation. First, we have sougt to protect the consumer against the commercial manufaeture and sale of oleomargarine colored yellow in imitation or semblance of butter. Second, we have sought to proteet the nation's dairy industry against the loss of its vital butter market through unfair competition.

"It is not generally understood that butter produetion is essential to our continuing supplies of milk and meat," Mrs. Taylor declared. "Without butter to absorb surplus milk produetion in summertime, there would be shortages of milk and meat during the winter months. Almost 50 per cent of our beef and veal now eomes from dairy herds, which are at their lowest level in years. Further inroads into the butter market through fraudulent sale of oleo eolored yellow in imitation of butter, at the faetory or in public eating places, will be refleeted by increased scarcity and still higher prices for milk and meat."

In addition to the National Cooperative Milk Producers' Federation represented by Mrs. Taylor, the new policy has the support of the American Butter Institute and the National Creameries Association. Congress and state legislatures will be urged to prohibit the use of "commercial yellow" by oleo manufacturers.

Clinton Mooring of

(Continued from page 1)

ants for 18 years. Last year they were offered $20,000 for it. "We bought our farm,," Mrs. Myles Mooring says, "by scrimping and saving and we plan to hold on to it. Most of the money for the farm came from the sale of chickens and eggs and the things we grow on the side along with our cotton; we grow most of our own food, too.

"Now my husband and Clint are getting started with hogs and cattle," Mrs. Mooring continues, "by the time Clint is out of college, we ought to be ready to really go in for live stock."

More Poultry, Milk, Lambs Urged in 1949

Washington, Dec. 1—(IP)— The government called on farmers today to produce more milk, poultry and lambs in 1949.

But it suggested smaller acreages for flaxseed and rice than were planted this year.

The recommendations were contained in a list of produetion goals put out by the Agricultural Department. The department sets goals each year for most of the nation's major crops. However the program is entirely voluntary.

Simultaneous with the announcement of produetion goals the department reported that recent large harvests permitted U. S. food exports to reach an all-time high of 19,000,000 tons in the year ended June. At the same time, food consumption per person in this country remained at 14 per cent above the prewar level.

The U. S. population ate 84.7 per cent of the food it produced and sent most of the rest overseas under the European Recovery Plan, the report said.

Wheat exports of 13,018,000 tons were the largest ever. The department earlier this year suggested a cut in wheat acreage for 1949 to avoid a surplus here. Indications are that farmers may not comply.

Goals announced today include:

MILK—120,000,000,000 pounds, up 3 per cent over estimated 1948 production.

POULTRY— 700,000,000 chickens and 35,100,000 turkeys both up 10 per cent from this year. The aim is to provide 370 eggs, 23.5 pounds of chieken meat and four pounds of turkey. Consumers now average 380 eggs per person, eompared to 298 before the war. An anticipated increase in meat supplies next year is expected to cut down the egg demand.

SHEEP AND LAMBS —An increase in stock to $30,500,000 head Lamb stocks are now lower than at any time since 1867.

FLAXSEED— 3,026,000 acres to produce 26,700,000 bushels, 36 per cent below the planted acreage this year.

RICE—1,600,000 acres to produce about 73,888,999 bushels, eight per cent below 1948 aereage.

SWEET POTATOES — 607,000 aeres to produce about 57,000,000 bushels, eight per cent more than this year's output.

SUMMER VEGETABLES —717,850 aeres of 18 vegetables, slightly above 1948 acreage and calculated to produce 3,162,000 tons.

PEANUTS—Because of a declining demand. Brannan said peanut growers — mostly in the South — must limit next year's erop to 2,611,367 acres, as compared with 3,340,000 planted this year. The 1949 output will be grown and marketed under rigid government controls authorized by a growers' refendum a year ago.

Less than fifty years ago, petroleum supplied only eight per cent of the nation's total energy. Today, almost half the energy is derived from petroleum and natural gas, and their use is increasing steadily.

The Eyes of the World Are On America

By Maeanna Cheserton-Mangle

When the East meets the West, can it live cooperatively in a world organization? At present our political, economic and religious convictions seem distinct and irreconcilable. It is becoming increasingly obvious that the major problem that faces the world as it seeks the way to lasting peace, is how nations of differing ideologies can dwell and work together harmoniously.

It is here that America can make a major contribution. In the confines of every large city in the country, people of most diverse backgrounds and philosophies dwell together. In the United States we have adherents of every living religion, and those who profess none; those of every national origin and of all racial strains. Here we can demonstrate that unity IS possible without the imposition of uniformity. To make America safe for differences in perhaps the greatest contribution that, as a people, we can make to a world that faces the same problem on a global scale If it can be done here, the peoples of the world will be encouraged to believe that they can do it too. The eyes of the world are on America.

Some time ago John Foster Dulles said that "By developing common peacetime goals, the United Nations may revive the spirit of brotherhood which existed when the United Nations were fighting for eommon wartime goals." We do not deny the differences of religion, race and national origin; but we are discovering that beyond all these we can and have found common civil goals on which we ean unite. With mutual respect for the differences that tend to separate us, we can cooperate in those undertakings which are our common interest and responsibility.

Common interests make us strive for common goals. Common goals lead to common devotions; devotions to life, liberty and the pursuit of happiness through a nation that grants liberty and justice for all. But America is not an isolated spot in the universe, where it may live apart from the rest of the world. At this very moment there are things about us and our way of life that are influeneing other nations throghout the world. What are we doing to secure eivil rights for our people? Do we preach Christian love and yet betray those about us by denying them full rights in a free world? We have a voice in the United Nations. But to let our voices be heard with eonviction, we must have a clear reeord behind us. It is not even logieal to protect a man's person and at the same time to prevent him from having proper edueation or earning a living because of the color of his skin or the faith he professes. It is not enough to allow him to worship as he will, if we discriminate against him because of the way he worships. We eannot urge tolerance and understanding in world associations if we do not have it at home. We eannot hold for an International Bill of Rights which includes items on which we ourselves are remiss—we eannot—and look our neighbors in the eye. If we live as we have preached, if we ean project the spiirt of that life into world affairs, some of the prineipal difficulties that hinder the operations of the United Nations today will be resolved.

Thus the matter comes back to us. As Christians, in a so-ealled Christian land, we must live more nearly as we pray, more nearly as Christ would have us live, "in love of the brethren, tenderly affectionate one to another; in honor preferring one another . . . at peace with all men." Then, and then only, can we lift up our heads as we speak in the halls of justice.

—Religious Press Committee

Did you know that the first oil well drilled in the United States, in Titusville, Pa., in 1859, was only 69 feet deep? Today, modern equipment and progressive methods enable oil men to probe the surface of the earth in the search for new oil.

Putting Pep Into The Party

By Roy L. Warren

Put pep into the party by starting the playing with the game of handshakers. This is one that gets everyone acquainted early in the evening. Each of five guests is given, unknown to the rest, what is described as "a valuable picture of Thomas Jefferson." It is then announced that nobody shall be told which five of the guests have this valuable picture, but that everyone is supposed to shake hands all around the room, and the twentieth person to shake the hand of each of the five guests will be given one of these pictures as a prize.

This immediately starts a round of handshaking that continues for quite a few minutes. The five guests who have the "valuable pictures of Thomas Jefferson" keep count of the number of people who shake their hands, and at the end of the game come forward and award their prizes—the "valuable" pictures, consisting of regulation three-cent stamps.

Ever play "Buzz?" Any number of boys and girls may play. Each one calls out a number in turn starting at one and going on until all are out of the game. The word Buzz must be used whenever the number is seven, a multiple of seven, or is written with a seven. Thus, seven, fourteen, seventeen, twenty-one, twenty-seven, twenty-eight, etc. are Buzz numbers. The seventies are counted Buzz 1, Buzz 2, Buzz 3, etc.

Any player who calls a number when he should say Buzz or says Buzz when he should say a number is out of the game. The player who stays longest is the winner.

Here is a game called "Unseen Treasures." The guests are seated in a circle and each one has to be blindfolded. The leader has a basket containing at least twenty miscellaneous objects, such as a potato, a buton-hook, a shoestring and other things which should be recognizable to the touch.

The leader starts passing these objects, one at a time, to the one at the head of the circle. This person feels the object, makes a mental note of what he thinks it is, and then silently passes it to the one next to him. When all of the objects have been passed, and are once again concealed in the leader's basket, the blindfolds are removed and each guest is given paper and peneil and told to list as many of the objeets as possible. A prize is given to the one wit hthe longest and most aecurate list.

Let us end with "Newspaper Notables" In advanee of the party, clip from various newspapers or news magazines the photographs of twenty people who at the present time are well-known national figures. Show a number from one to twenty beneath each picture, but do not identify the picture, in any way, and place them around the room where all your guests may see them.

Number One, for example, may be a Supreme Court Justiee. Number Two many be a prominent minister or bishop, and so on.

When the game is started, each person present is given a sheet of paper, and told to write down the names of as many of the twenty as he can, opposite the figures from one to twenty. Some very surprising lists will be the result. Whoever writes the most accurate list gets a prize.

Guernsey Brings $28.600 for New All-Time Record

Riegeldale Ben's Melba, a two-year-old Guernsey heifer, was recently sold for $28,600 to set a new all-time-high price for a dairy female.

The sale was by Dr. John R. Martin, Chattanooga, to Mrs. Helen J. Weyenburg of Thiensville. Wisconsin.

Dr. Martin had previously purchased the animal from Ralph W. Corsey, manager of Riegeldale Guernsey farm at Trion, Ga., for $26,000.

Little Sermons For Juniors

Mrs. Joe Trussell

These things understood not his disciples at first; but when Jesus was glorified, then remembered they that these things were written of him.—John 12:16.

WHEN YOU ARE NOT UNDERSTOOD

Are you one of those misunderstood persons? If so, don't grieve. The essence of littleness is to be understood.

Think of the shallowest person you know. No trouble to understand him, is it? Why, you even know what he is going to say before he begins.

Now think of the finest person you know. You have to listen to him. Often, long after he had stopped talking a new understanding of his words suddenly comes to you, even as it did to the disciples of Jesus. Nor is Jesus the only person in the world who was not understood. Such men as Einstein, Washington, Lincoln, Napoleon, Emerson, and Carlyle were too great to be understood

Strive then for greatness and don't bother about whether you are understood or not.

Loving Someone You Have Never Seen

By J. Arthur Springer, Moody Bible Institute, Chicago

Yes, it's possible to love someone you have never seen! In fact, a great many persons have done so, and are doing so today. Mark well, it is not someone they do not KNOW, but someone they have never SEEN.

Millions of persons love the Lord Jesus Christ, though they have never seen Him. But they know Him! Otherwise they would not, could not, love Him. But, you see, they love Him because they know Him—by faith. They believe and therefore rejoice because of the wonderful truths they know by faith. Peter speaks of this in his first epistle, where he says: "Jesus Christ, whom having not seen ye love; in whom, though now ye see him not, yet believing, ye rejoice with joy unspeakable and full of glory" (1:7, 8)

By faith, we Christians know the Lord Jesus, His love, His graee, His salvation, His care, His provision, His protection, and a host of other things. And, sinee we know these things, and more especially because we know Him, we love Him and rejoice in Him And what a glory sueh faith, such knowledge, and such rejoicing bring to us! It is beyond all descrition. And, furthermore, it is something of whieh no one, and no circumstanee, can possibly deprive us.

Such treasures ean be the posession of anyone on earth—they all come through believing on the Lord Jesus Christ, the Son of the living God, as Saviour and Lord and Friend.

Here's Doc's Story Now You Tell One

Los Angeles, Calif.—(G) — A siren that brews coffee, lights a pipe, pops popeorn, kills roaches and mice is the latest in ultrasonic gadgets. It will also wash your clothes 60 times faster and somewhat cleaner than a washing machine, homogenize your milk, and precipitate smog.

Many of its ehores are dependent on the conversion of sonic energy to heat energy. For instance, tobaceo in a pipe absorbs the sound energy when exposed to the siren sound field. The sonic energy is then converted to heat energy and the tobacco ignites.

A mouse's body temperature is raised so high in one minute's exposure to sonic energy that it dies.

Dr. Isadore Rudnick, graduate of the University of California at Los Angeles and now associate professor in the U. C. L. A., physics department has been instrumental in the development of this high frequency "super-whistle."

Throw Out The Life Line

The theme of the article is that title of one of our old gospel hymns. It has been sung since the day Edward S. Ufford wrote it in 1886 and doubtless will be sung by countless multitudes, young and old, rich and poor, until Jesus comes. Some who sing it no loubt thing little about the meaning of its title, "Throw Out the Life Line." Others have sung it not only with a knowledge of its meaning, but also with a feeling of compassion in the heart aroused by the vision that prompted the author to write it.

THE TRAGIC NEED OF A LIFE LINE

Let us look, first, at the tragic need of a life line. The need is universal. Since the hour that Adam fell, the human race has been lost in the great ocean of sin that covers every nook and corner of theearth. "For all have sinned and come short of the glrry of God." "There is none righteous, no not one." Every one is deprived and helpless. The billows of time do not wash men safely to shore, but every billow, every day and hour, carries the victim farther and farther away from the Ark of Safety, toward his waiting doom. Race, color, education, or social standing make no difference. When Adam fell, the race fell with him. "In Adam all die." That is a dark picture indeed, but God in his infinite mercy made provision for our reseue.

There is a life line, the only one, that will bring the doomed and helpless sinner safely to the shore. That life line is Jesus. He came "to seek and to save that which was lost." He is the only life line. "For there is none other name under heaven given among men, whereby we must be saved."

WHO POSSESSES THIS LIFE LINE?

The most revealing and most oft-forgotten fact in all of this world concerns that "life line." Who possesses it? Every Christian has the life line, for every individual who has been saved by faith in Jesus has within him the life line. Peter said to the crippled beggar: "Silver and gold have I none; but such as I have, give I thee: In the name of Jesus Christ of Nazareth rise up and walk."

The world is filled with lost people. One of our Southern states has seven million lost people living within its boundaries. Every child of God has a life line that will rescue the sinking, dying, doomed sinner. One does not have to be a preacher in order to possess it. A saved Junior boy or girl has it. Every man and woman who has been redeemed has it. God is depending on all believers to "throw out the life line." The perishing souls have no one but believers to whom to look for help. Lost sinners are all victims. They cannot point one another to the shore. The blind cannot lead the blind. What an unspeakable responsibility we bear and share. God help us to realize the privilege of reseuing doomed sinners.

DO SOMETHING WITH THE LIFE LINE

The supreme need of this hour is action on the part of believers. We talk about soul-winning, we pray about soul-winning, we write bout soul-winning. These are good as far as they go, but they do not go far enough. God said o Moses: "Wherefore eriest thou into me? speak unto the ehildren of Israel, that they go forward." People are dying in sin. God wants action. The situation demands aetion. If we saw people drowning in water and we had a life line, would we stand on the bank and talk about it? No, we would, with all of our strength, throw out the life line to the drowning person and pull him to shore.

The Baptist Training Union Magazine

Dr. V. S. Nyabongo Welcomes 71 New Freshmen At A. & I.

Seventy-one freshmen and new students enrolling for the Winter quarter at Tennessee A. and I. College were welcomed at a eonvocation by Dr. Virginia S. Nyabongo, director of student personel services, on December 15th in the auditorium. The total student enrollment for the quarter is expected to exceed 2,00.

Dr. Nyabongo advised the incoming group to observe a discipline for their life both socally and personally. "Careful selection of organizations with which to ally yourselves on the campus and which to contribute your time, interest, and support will do much to enrich your college experience and broaden your life," she stated.

The speaker suggested that students allot a definite amount of time for the various studies and activities they expect to accomplish daily.

Highlighting the orientation period was an informal party for the newcomers on December 14th in the Little Theatre.

Fewer Graduates Of Colleges Getting Corporation Jobs

Evanston, Ill., (G)—A recent survey of the personnel needs of 173 large companies showed that the nation's large corporations appear to have reached a leveling-off-point in the employment of college men. according to Dr. Frank E. Endicott Director of Northwestern University's bureau of placement.

However, Dr. Endicott felt that the leveling-off in no way indicates that the hiring of college graduates is falling off seriously, although the companies queried reported a decrease in the number of college graduates to be employed next year, no sharp drop is seen. A strong demand still exists for engineers, general business trainees and sales and accounting personnel.

The rapid postwar increase in the hiring of graduates was attributable to expansion programs in business and industry, he said. This expansion is now fairly complete, and eurrent employment needs are largely those of replacement, he pointed out.

Testimonial Given Pres. W. H. Gray Of Florida A. & M.

Daytona Beach, Fla.— (G) — On November 27, Bethune-Cookman College was the scene of a testimonial to Dr. William H. Gray. youthful president of Florida A. & M. College.

Present to assist Dr. Richard V. Moore, president of Bethune-Cookman was Dr. Mary M. Bethune, founder and president emiritus of the College. Dr. Gray was honored because of his meritorious serviee in the field of education He eame to the presidency of Florida A. & M. five years ago at the age of 32, the youngest ever to be elected a president of a land grant college in America.

During this five years Dr. Gray has secured several million dollars from the Florida State Legislature for improvements and additions to the State College at Tallahassee.

This young educator attended St Paul Normal and Industrial Institute of his native Virginia. He was graduated from Bluefield State Teachers' College and received his Master of Seience and Doctor of Philosophy from the University of Pennsylvania.

Petroleum production in the United States today is at an all-time high—is equal to the entire world's output of only ten years ago. Even though 1947 broke all records for the amount of oil supplied, the industry has been successful in discovering an additional 29,605,000,000 gallons over that year's production lifting known underground oil to the highest point in history.

Modern medicine makes wide use of petroleum. In one form or another, it used to relieve coals by shrinking nasal tissues; in anesthetics, sedatives and hypnotics; to reduce blood pressure and to stop bleeding in synthetic rubber products and for stethoscope and other instrument parts; in antiseptics and in petroleum jellies: and for man yother medical needs.

Safeguarding Our America

Article Written By Joseph H. Kendricks

"Educators. faculty parents and friends. I am VERL MUCH pleased for having this opportunity to speak to you this evening. First, because this is my Alma Mater and each of us has a soft spot in our heart for the school which we call our alma mater. Secondly, on such an important occasion this meeting is, in the civic life of Haughville. I, as one youth, feel highly flattered to be able to speak for the youth of Haughville when the occasion means much. I understand that I am to talk informally to you tonight on the subject, "Safeguarding our America." Much has been said about safeguarding American principles and defending the cause of Democracy, but little has been done about it. Therefore, in talking tonight I aim to further the aims of the dedicator of this institution- In calling them courageous I am not necessarily thinking of myself as a courageous youth. The office of President of this organization is on an infinitely smaller scale, conquerable to the office of the President of the United States. Both Presidents are merely figureheads.

The real strength lie in those many persons who made him such. America has ideals which must be safeguarded members of thte Haughville Youth for Canteen feel that they are doing their little bit in safeguarding this glorious heritage by doing what they can to make better citizens out of themselves now, in order that when they become leaders of THIS community, which is after all an integral part of America, they can better serve the community and through it, America.

Often we think of safeguarding American principles as something for a mass Army, the Senate, Congress, and for everyone but ourselves. Each person who enjoys the privilege of calling himself a citizen of this majestic United States while at the same time I help achieve the end of the couargeous group of youths who call themselves The Haughville Youth for Canteen of America should assume the responsibilities of citizenship as intensely as he enjoys its privileges. This, in our small way, we as members of the Haughville Youth for Canteen are attempting to do. We are fully aware that loitering on street corners, attending public affairs that are not chaperoned, and in general, having a reckless good time are not conducive to that frame of mind which preares one for the responsibilties of being a citizen of this the pride of the universe. We must learn as early as possible the underlying characteristics of American citizenship. In role of a surpressed minority, we have a harder fight than the average American citizen In the face of persecution, we have a hard time remembering that it is not better to reign in Hell then to serve in Heaven. as did Milton's characters. Possibly Hell is strong language for such delicate ears that are now listening, but what would we call the condition in which we find ourselves, being a persecuted minority in any other country than our own. Negro Youth then need particularly careful handling. Without money, without a strong cultural background, chiefly without family tradition, they find it difficult to believe in this glorious wealth of nation. What matters it to our youth if this country is the crown and glory of this world if he does not share in that glorious entity. It is exactly against such abject thinking that you must safeguard youth, me and the boys and girls that you see scattered through out this auditorium; for an unhappy servant is a dangerous one, and we are after all servants of this country

You, dear listeners, have an important role to play in seeing to it that we safeguard our American rights. In your hands lies the fate of a small, but nevertheless important role to play in seeing to it that In your hands lies the fate of a small, but nevertheless important parcel of American citizenry. Therefore, I stare you in the face with a challenge. Can you meet it? Dare you get behind these few courageous youth who have themselves felt the need of a clean recreational institution. Are you able to say "Yes", we are as interested in you as you are in America. This may seem like dilating the issue to proportions far exceeding its importance. We answer, "Not At All". All of us know the adage that all work and no play makes Jack a dull boy. A dull boy becomes a dull man. A dull man IS NOT a good citizen. We who are not good citizens CANNOT SAFEGUARD AMERICANISM.

At the resent time, youth, and Negro Youth particularly are lured away from Americanism by the false promises of Communism, socialism, and other ISMS who promise more than does Americanism. Will you sit back calmly and see us tempted into way of error by these promises, the wonderful land of hope.

In thinking of character building, wise men never overlook the importance of Recreation. Nor does the wise man ignore the recreation progress of the modern age. He realizes that in order for youth to be satisfied, youth must really have its fling. You have a lot to say about what this fling will be. Many of you present now, were teenagers in the 20's when the youthful hero drank, raced around in a family car, wore beaver coats, and generally was a menace to society. Youth today have outgrown this recklessness. They do not care for wild, reckless, haywire, fun seeking. They do want a good clean time. Without it they seek other things. Perhaps I have wandered from my subject, as I look back to the top of my paper, I see that the title in "Safeguarding Our America." I say that if we must safeguard our America we must do it logically and in awareness of the strides o fModern Education. We see here tonight, beautiful well-equipped, externally complete institution of Education. These beautiful walls, these lovely floors, this handsome auditorium, these well constructed seats are only means to an end. They are not an end in themselves. If in using them we lose sight of these all important functions of molding the citizen of tomorrow, we have committed a crime against Americanism. It is only through real thinking and cognizance of the real place of the Youth of today that the America of tomorrow will be strong, safeguarded from the enemy within and the enemy outside.

Let your light so shine before men, that they may see your good works, and glorify the Fathor which is in Heaven.

THE PLAY OF THE HOUR!
Listen, America!
The Negro Mother appeals to America for justice to her children.
Colorful; Forceful; easily staged
Suitable for Churches, Schools, Clubs, Youth Groups
Playing time: 45 minutes
50c per copy in lots of four or more; no single copies sold
OCTAVIA B. WYNBUSH, 2319 Troost Ave., Kansas City 8, Mo.

THE COLORED
YMCA

Can Accomodate
TRANSIENT MALE PATRONS

When coming to Nashville you are requested to stop at the Colored Y.M.C.A., Fourth Avenue North and Charlotte Avenue.

The rooms are located on 3 floors. Splendid outside rooms with much of the modern conveniences.

It is located in near down town Nashville.
There are clerks on duty twenty-four hours every day.

The rents are reasonable.

If any man wishes to take permanent residence in the building, this can be arranged.

Come to the Colored Y.M.C.A. while in the city.

COLORED YMCA INCORPORATED
Fourth and Charlotte Avenues
Nashville 3, Tennessee

Teacher: What is a sawhorse?
Pupil: Past tense of sea horse.

EVERY $3 HERE WILL BUY ME $4

and I know my home and farm will be secure!

Every clear dollar I can lay my hands on these days goes into safe, sure U. S. Savings Bonds. Nothing I could buy at today's high prices could equal the thrill I'll get out of putting Jimmy through college with the money.

And about that time I'll feel like taking it easy more, vacationing and travelling to places I always wanted to see. My bonds, paying off $4 for $3, will foot the bill easy.

Just like any smart businessman, I'm laying away a reserve of U. S. Savings Bonds to modernize my farm and home. And I like to remember I'm helping my country, as well as myself.

BUY U. S. SAVINGS BONDS!

Former Nashville Business Student On Lincoln Staff

Jefferson City, Mo., Dec. 11, 1948 —Helen D. St. Clair, former student in business administration, West Virginia State College, and of the National School of Business Administration of Nashville, Tenn., and native of Roanoke, Va., has joined the Lincoln University (Mo.) staff of workers as secretary to the dean's of personnel.

Before coming to Lincoln, Miss St. Clair worked as secretary to the dean of women and superintendent at the National School of Business, Nashville; and during World War II she was employed by the federal government at the New York Port of Embarkation.

Colored Pastor Heads Ministers Of Battle Creek

BATTLE CREEK, Mich. — (Atlas News Service) — Dr. James A. Dean, pastor of the Mount Zion A. M. E. Church has been elected president of the Battle Creek Ministerial Association.

Dr. Dean is a graduate of the University of Michigan, and becomes the first Negro to head the Battle Creek Cleric Association.

ECONOMIC HIGHLIGHTS

Happenings That Affect the Dinner Pails, Dividend Checks and Tax Bills of Every Individual National and International Problem Inseparable From Local Welfare.

If the judgment of representative business leaders is correct, those who anticipate a drop in the cost of living are doomed to disappointment. The outlook now is that some prices notably foods will probably decline during the coming year. However, even if this happens, it will be offset by higher prices in other directions, principally in the field of manufactured goods

A recent statement by Henry Ford II indicates the trend of thinking on the top industrial levels. According to him, a fourth-round wage increase" is inevitable." Then he said: "Prices, too, must go up. Prices are high today maybe too high--but we can't lower them without lowering wage and material costs." When asked for his views on price control, Mr. Ford said it would not hold prices down and "would wreck the nation the auto industry included--and ruin the economy."

The attitude of the principal labor leaders is also indicative of things to come. At the recent CIO convention in Portland, Orgon, Mr. Murray, Mr. Reuther and other high executives in the organization laid most of the emphasis on plans for obtaining repeal of the Taft-Hartley Act, and for the farming of legislation which, in their view, would be favorable to labor. At the same time, they made it perfectly clear that they will demand, as a general thing, substantial wage increases. The AF of L is not so aggressive in attitude, but there is little doubt that it will follow a simular policy.

It might be argued, as a theoretical proposition, that higher wages need not constitute any particular problem to industry--that all it has to do is to raise its prices to compensate and carry on in the same old groove. But that argument, in many cases, is simuly not workable in practice, and for a variety of reasons.

First, there is a group of basic industries which cannot adjust their charges without permission of one or more governmental agencies. These are regulated industries, of which the railroads are the most conspicuous example at present. In spite of the rate increases they have been given by the Interstate Commerce Commission, their return on investment is only about three per cent. Very heavy demands for wage increases are being made on them, and more may follow. Even if the ICC should continue to grant higher rates to compensate for changing conditions, the time factor involved is serious. Wage raises, when granted, go into effect at once and are often retroactive. Higher fares and freight charges are normally granted only after many months of investigation and are not retroactive. Even then, as a general rule, the rate increases are quite sufficient to offset the wage boosts.

There is another group of industries which must meet foreign competition. Here shipping is the best example. According to the statistics, seamen's pay has risen 207 per cent since 1939. The maritime unions want still higher wages, along with other expensive concessions. At the same time, the companies' volume of business and their profits have declined. Foreign lines, which pay far lower wages and can operate more cheaply in all ways, are getting more and more tonnage.

Finally, there are any number of industries which are perfectly free to raise prices as high as they like, but which must keep a worried eye on the consumer. In other words, it is one thing to price an article at a given figure, but it is a different thing to get people to buy it at that figure. Consumer resistance has become an ominous factor in a number of fields, and is feared in others. On top of that, it is not only the individual buyer that must be considered. The big industrial consumer often dominates the picture. For instance, coal is a cource of energy which must be sold in competition with other sources of energy, such as oil. If coal prices should get out of line, there would be a gradual shift to other fuels and then, of course, the employment offered by coal would steadily decline.

Industries serving the demand for luxuries and semi-luxuries--things people can do without if they have to are especially concerned as the wage problems moves to the front again. Motion pictures are a good illustration of this. Box office receipts in the United States have been drifting downward. There has been a heavy decline in foreign income, due to currency restrictions, freezing of funds, and stiff taxes abroad. The top movie minds think that current ticket prices cannot be further raised without a shattering affect on attendance. Efforts to reduce the production costs of pictures and still keep them attractive to the potential customer have not been too successful. So here too the prospect of higher wages is the cause of many a headache.

Labor argues that increases in living costs have made higher wages necessary. Industry replies that the trend of living costs is inevitable tied to the trend of wages. There is a great deal to be said on both sides. The problem is to find a common meeting ground. Efforts in that direction will take up a large share of the national energy during the coming months.

Bookmobile To Serve Negroes

Public library service will be extended to Negroes in all sections of the city of Nashville through the bookmobile, beginning Monday, January 17, 1949.

15 stops will be made each week at various locations. Books may be borrowed free for two weeks on our public library card: The best selection of new books for children and adults will be available.

Ask your extension librarian for books you want to read, to find information you want to know, and to suggest good books for your entertainment.

You are invited to come to the bookmobile at the stop nearest you.

Bookmobile schedule:

Monday

N. C. I. — 24th and Batavia, 2:30-3:30.
26th and Jefferson, 3:45-5:15.
18th and Jefferson, 5:30-7:30.

Tuesday

7th and Man, 2:30-4:30.
8th and Slyvian, 4:15-5:15.
12th and Jefferscon, 5:30 - 7:30.

Wednesday

33rd and Albion, 2:30 - 3:30.
28th and Clifton, 3:45 - 5:00.
Clifton School, 5:15 - 7:30.

Thursday

12th and Edgehill, 2:30 - 4:15.
J. C. Napier Courts, Lewis and Lafayette, 4:30 - 6:00.
1st and Lafayette, 6:15 - 7:30.

Friday

17th and Jo Johnson, 2:30 - 4:15.
14th and Sigler, 4:30 - 5:45.
Villa and Grand Avenue, 6:00 - 7:30.

Colored Girl Sent To Convention By AVC of Florida

Miami, Fla.—(G)—Race relations showed themselves to be much on the upgrade in the South this year when the Miami AVC Auxiliary sent Cory Paschal as a representative from their inted-racial group to the National Convention in Cleveland, Ohio last month.

The Convention, which convened in the downtown Hollenden Hotel was most cordial to this alert young woman from Chapter 34 of the AVC giving her service in many key positions during the sessions.

Miss Paschal is co-chairman of her Chapter in Miami.

Educational Institutions Whose Programs Are Geared To Give Instructions to Old and Young

Land Grant Colleges and Associate Land Grant Colleges, with the States and Towns In Which They Are Located, Correct Names and Addresses of Their Presidents to Whom Readers of the Modern Farmer May Write

Twenty-four schools whose curriculum has been accepted by State Boards of Education, in which the youth can major in subjects that he likes best, and where he can pursue such study courses which when he has finished will help him in his life's work. These institutions challenge the admiration of the educated people of today. They are Land Grant Colleges and Associate Land Grant Colleges. While they do specialize in agriculture, home economics, dairying, farming, cattle raising, poultry raising, truck gardening and other pursuits of industry and agriculture, they are doing this because there is need for them. There is no race, no creed or color in vegetables, poultry, butter, eggs, beef, pork, beans, potatoes; in fact, what the world subsists upon, nobody asks—who raised it? So therein, lies the solving of much of our high cost of living.

The Modern Farmer therefore, invites the readers to write a letter to each or all of these colleges and ask them to send you their Catalogue so that you can read, study and make your own decision from the following schools:—

LAND GRANT COLLEGES AND PRESIDENTS

Alabama (Normal) A & M Institute; President J. F. Drake
Arkansas (Pine Bluff) State College; President L. A. Davis
Delaware (Dover) State College; President H. D. Gregg
Florida (Tallahassee) A & M College; President W. H. Gray, Junior
Georgia (Savannah) State College; President James A. Colston
Kentucky (Frankfort) State College; President R. B. Atwood

National Boy Scouts Sunday

Date Set By New York Officials Is Feb. 6, 1949 For Denominations

Scout Executives, Assistant And Field Executives Have Been Sent Copies of the Announcement and Selection Of Date

NEW YORK, N. Y. — Executives of the Boy Scouts of America have announced National Scouts Sunday as February 6, 1949. The announcement says:

"Our 39th Scout Anniversary Week theme "Adventure—That's Scouting" can, with a little planning in aavance, start on Scout Sunday, February 6, 1949 with an adventure in Christ-like living for many of your Councils' Scouts and Scouters. The aims of Scout Sunday observances are to dramatize to the public and to impress upon Scouts and Scouters alike the deep spiritual and religious foundations in the Scout Promise and the Law. To stimulate the thinking and to guide the planning of Scout Executives for proper Scout Sunday observance by the Catholic membership in their Councils, these suggestions are given;

1. All observances by Units under Catholic auspices obtain their sanction and authority from the bishop of the diocese. Therefore, consult your Diocesan or Area Scout Chaplain about all plans involving Catholic boys.

2. Any ceremony in a Catholic Church must have the approval of the Pastor of that Church.

3. Catholics are not permitted to take part in union religious services—that is, serviees conducted by other than Catholie clergy.

4. It is not proper for Scout officials to suggest to Catholic priests sermon outlines for use on Scout Sunday. The Diocesan or Area Scout Chaplains well may suggest to Troop Chaplains that they weave intto their sermons adventure stories about the lives of God's Heroes, the Saints. These are appropriate to the general adventure theme of Scout Week and are most appealing to Scouts.

5. Some practical methods for Scout Sunday observance which have been used successfully by Catholic Units are listed below under three headings: (A) In the Individual Parish; (B) City or Area-wide Observance; (C) Diocesan-wide Observance:

A. IN THE INDIVIDUAL PARISH

1. The Parish Scout Troops, Cub Paiks and Senior Units attend Mass and receive Holy Communion in Uniform in the parish church. In many instances, the pastor arranges for a sermon on Scouting during the Mass. It is common practice for the Scouts to assemble in the parish hall before the designated Mass and to mareh into the chureh with U. S. and Troop Flags, aecompanied by Unit Committeemen and other leaders. Frequently, permission is given for Scouts to serve the Mass in Scout Uniform.

2. The Scout Communion Mass can be followed by breakfast served by the Seout mothers or other parish group. Appropriate talks on Scouting should be arranged as part of the breakfaet program. The speaking should be kept brief. All talks can point up the 1949 theme for Boy Scout Week—"Adventure—That's Scouting."

3. Some parishes use Scout Sunday as the occasion of an impressive Church Investiture Ceremony for all new Cub Scouts, Boy Scouts and Senior Scouts of the parish who have not been publicly invested during the year. Review copy of the new pamphlet "Catholic Investiture for the Whole Scout Family." (Order from Supply Service, B. S. A., Cat. No. 3088, Price 10c each.)

B. CITY OR AREA-WIDE OBSERVANCE

The Area Chaplain and Scout Executive, with the approval of the Diocesan Chaplain, plan on a city, deanery or area-wide basis for a convocation of Scouts in the afternoon or evening of Scout Sunday in a centrally located Catholic Church. The program might highlight a Church Investiture of all new Scouts. It can be developed as a sort of "Church Court of Honor" where the Scouts who have advanced in the Scouting ranks during the year are recognized. Their badges of rank can be blessed and the Scouts of each rank, in unison, recite the Scout Oath or Promise before God in the Blessed Sacrament. This ceremony concludes with Benediction of the Most Blessed Sacrament, during which the Scouts rededicate themselves to the patronage of the Blessed Mother.

If the Catholic leaders in Scouting prefer a city-wide observance with Mass and Corporate Communion, it could be held on Saturday at a central church. If held on Sunday, it may cause misunderstanding in the parish churches by taking boys away from their routine parish duties as altar boys, choir boys, etc.

C. DIOCESAN-WIDE OBSERVANCE

In many dioceses a general convocation of Scouts is held at the Cathedral. Here,, the Ad Altare Dei Crosses are presented by the Bishop to deserving Scouts. The program generally is carried out within an hour, including parade into the Church, blessing of flags, presentation of A. A. D. Awards, sermon and Benediction of the Blessed Sacrament. This type of central observance is not practical in some dioceses because of the distances involved and the possibility of inclement weather at this time of the year. Such programs are worked out by the Diocesan Scout Chaplain with the cooperation of Area Chaplains, Lay Committee Chairmen and local Scout Executives.

Note:—Local Councils can aid in the Religious Awards promotion by having available the new A. A. D. Requirements book for use of Scouts (order Supply Service, B. S. A., Cat. No. 3093) and the A. A. D. Application Form (Supply Service, B. S A. Cat. No. 4423).

PUBLICIZE AND PLAN IN ADVANCE

Whatever programs are planned, the details must be developed and approved by Church authorities, and in the hands of the parish Scout Leaders long in advance. Adequate publicity should be given to the events in the diocesan papers and parish bulletins, as well as in the local press. Plan now to have Scout Sunday on February 6th, 1949 observed by as nearly as possible 100 percent of your membership.

Rev. A. C. Goodloe Heads Baptists In Kentucky

By H. E. GOODLOE

At a recent meeting of the National Baptist Convention of America, the Kentueky branch, Rev. A. C. Goodloe was elected president for the ensuing year. Below is a letter that Rev. Goodloe has sent to the Kentucky members. The writer wishes Rev. Goodloe mueh success and hopes that this will be a banner year for the National Baptist Convention of America in Kentucky.

The letter is as follows:

Dear Brethren of the National Baptist Convention of America:

One of the greatest surprises of my life came to me when I was informed by the Past President, Rev. E. M. Elmore, that I had been selected to be your president for the ensuing year. The Brethren must have had a lot of confidence in me for I was not even present at the meeting. This is to say that I will do everything within my power to prove true to the trust.

Like the little shepherd boy, David, I feel humble and sometimes ponder and say, "Why have I been chosen for such a big task in Kingdom Building? Why was so much thrown upon my shoulders? Then I finally came to the conclusion that it was done by a group of worthy servants interested in a better program for the Baptists of our state and nation. If this be true, then no job is too big for those who are stimulated to serve. Therefore I now issue the call to the Brethren and as I do so, I serve notice that for whatever labor you put forth, all honor goes to you. You can make this program as big as you are. You can make it a great work or you can make it nothing. I accept the call because I believe I have as my co-workers, the faithful few that made Gideon famous. Like Gideon, we go forth to battle sin, selfishness, and bigotry.

We have come; we have seen; and now we shall conquer. Why do we need men who have seen? Why do we need men and women imbued with the spirit to conquer? Simply this; "Then Baptist in Kentucky can render unto Caesar the things that are Caesar's and unto God the things that are God's May I ask, (Are there any Baptists in Kentucky who are unwilling to join this program?"

Finally Brethren, I make the following recommendations:

1. That in this world of unrest, we seek a sympathetic understanding with the great Baptist denomination in order that a greater job can be done in spreading the doctrine of "ONE LORD, ONE FAITH, AND ONE BAPTISM.

2. That national interest not be the guide by which we accept calls to churches, but that the Holy Spirit always be the major emphasis.

3. That all Boards working for the enlargement of the National program receive equal recognition.

4. That we hold no regional meetings this year, but instead, each Board's work be statewide and the reports will be made later at some central point.

5. That we give the women of our organization the recognition they so richly deserve and that they will not have to labor under the handicaps they have in the past. Such women as Mrs. Fannie Mayfield and her co-workers are doing an outstanding work in the field of missions. As your president, I urge you to give them every opportunity to enlarge the very fine program that they have launched.

6. Let us all use as our slogan, "On To Texas". As we use this, let us pool our resources in order that the following things can be done:

a. Organize the greatest soul-saving campaign in the history of the organization.

b. Organize Congress and Convention Clubs now so that churehes will be prepared when the time comes to go to these activities.

c. Advertising pays—Let the world know about our work and that the Convention is made up of churches not individuals.

d. Have your ehureh remember the slogan of the world mission program—"GO TEACH AND PREACH

Yours in Christ,

A. C. Goodloe, State President of the National Baptist Convention of America.

New Insecticide Found to Combat Japanese Beetles

Washington, Nov. 29—(UP)—The Agrieulture Department has found a promising new insecticide for use against Japanese beetle grubs.

It is ehlordane, a relative of DDT but 10 times better for the purpose, according to agriculture experts. Tests with 40 different kinds of soil indicate that only 10 pounds of chlordane per acre is required to kill 95 per cent of the grubs within a week and a half in warm weather the department said.

Four Thousand Dollars Paid To Beneficiaries

Relatives of Former Employees Received Checks Recently

National Bapt. Pub. Board's Secretary Tells of Benefits From Group Life Insurance

Since the return of the secretary of the National Baptist Publishing Board to his office after some of hop-skip and jump trips during which he fills engagements constantly, it was definitely learned and authentically stated that four thousand dollars in checks nave been paid to the survivors as beneficiaries of the last two employees who passed, under this group insurance plan carried on the lives of the persons so employed. He made a brief summary of the amount of moncy paid on the lives of former employees who lied at their post of duty and who had rendered yeomanry service in the National Baptist Publishing Board's plant of the National Baptist Convention of America.

The last two deaths occurred following the adjournment of the National Baptist Convention of America, at which time the secreary reported that the board was still protecting every employee with a Two Thousand Dollar Group Policy, augmented by an additional Hospitalization Policy, which provides for hospital fees, surgical treatment, nursing and the administering of anesthetics. The addition of the Hospitalization Policy does not take one penny from the Two Thousand Dollar Group Policy, and yet this policy has in it a clause where if one becomes disabled before he or she reaches the age of sixty, they get a life benefit of so much per month which he figures is around thirty dollars, as long as the person lives.

The plan was worked out as a protection to the employees of the plant, and as an encouragement to them for their loyalty, their service and devotion. It has been carried on the lives of employees for many years. More than thirty have passed since it was begun, and secretary Boyd estimates that while the two thousand dollars was not in force for the first few years, that more than forty thousand dollars have been paid to the relatives and beneficiaries of former employees of the National Baptist Publishing Board. Notably among these were the late Dr. E. R. Carter of Atlanta, Ga., the late Dr. J. L. Harding of Nashville, Tenn., however, the last two who passed, to the beneficiaries of whom the Insurance paid the two thousand dollars, was Mr. H. B. Haley, who attended the Convention in Oakland, California, and who worked only about ten days after his return before he took seriously ill and then passed. He was the head of the second-class mailing department in the plant. The other was Mr. Pete Goodrieh, who was employed in the cabinet department of the Publishing Board.

The secretary of the Board said he had recommened to the Board at its last annual meeting that this proteetion, this insurance and these polieies be continued on the lives of all those employed for 1949.

"The Greatest Story Ever Told" Has Powerful Effect On Listeners

New York, N. Y.—Though there are a number of ways of rating radio program listeners by means of the various organizations engaged in that work, there is no general way of knowing just how much effort those programs have on the listener. In the case of commercial programs that have a product to sell, sales figures might be some indication, but when a radio program does not attempt to sell any product, when it doesn't even have a word of commercialism, such as "The Greatest Story Ever Told," one might think that it would be hard to tell just what effect such a program has.

Just the opposite is true. The response to this dramatie presentation of the teachings of Christ has been marvelous. Though the program is sponsored by The Goodyear Tire and Bubber Company, none of its products is mentioned Not even the company's home address is given. The sponsor's name is mentioned briefly, because of a Federal Communication Commission ruling which requires it. Despite this, hundreds of letters a week are received, either by Goodyear or the various stations of the ABC network over which the program is heard Sunday at 6:30 p. m., EST.

The spirit of the letters refleets the purpose and intent of the program itself. Listeners would miss anything to hear the program. Families make it a point to hear it in a body. Churches and schools build their study groups around it; cllubs, hospitals, etc., put the program on their master speakers, so that everyone can hear it.

The east and all connected with the program are given sincre congratulations, especially beeause they all waive the usual radio credits, and work in complete anonymity. For the same reason, the sponsor is highly commended, since this is probably the only sponsored network program which is entirely free of commercialism.

There are many incidents about the effect of the program on the listeners, but the most interesting one came from a woman in a southern city who said that her car, parked in front of a friend's home, was taken by someone. Just a few minutes after she noticed that the car had been taken away and even before she had time to notify the poliee, she saw her car being returned. A teen-ag boy stepped out and said he had taken the car, intending to use it for a joy ride that evening, but listening to "The Greatest Story Ever Told" which was coming in over the car's radio, he changed his mind!

Fuller Mutual Life Insurance Company's Plans For the Future

MR. U. S. SOWLER, MANAGER SEEKS INFORMATION FROM SECRETARY BOYD ON GROUP INSURANCE FOR EMPLOYEES

During the month of January an important communication reached Nashville from Mr. U. S. Fowler, the manager of the Fuller Mutual Life Insurance Company of Austin, Texas asking Seeretary Boyd to give him full details and all information on how his company can secure group insurance protection on the employees, agents, office force of his organization, the Fuller Mutual Life Insurance Company, loeated in the capital city of the lone star state. Seeretary Boyd is personally acquainted with Mr. Fowler, beeause he is a member of the Ebenezer Baptist Church, located on Robinson Hill in Austin, formerly pastored by the late Rev. L. L. Campbell, D. D., who at the time of his death, was a member of the National Baptist Publishing Board, a member of the National Baptist Convention of America moderator of the St. John Assoeiation and pastor of the Ebenezer Baptist Church,

Mr. Fowler served for many years as superintendent of the Ebenezer Sunday School and worked often in the Superintendents Department of the Sunday School Congress. Secretary Boyd wrote him a full, explanatory letter and told him to get in touch with the proper authorities who would be glad to figure with them on a group policy for this Fuller Mutual Life Insurance Company, and would also figure with them on a Hospitalization Policy such as is carried on all the employees of the National Baptist Publishing Board in Nashville.

Preparations Being Made For Boyd Memorial

Sunday School, BYPU's, Mission Circles Active

All of Month of March Designated By Commission; Dr. A. A. Lucas, Chairman

During the month of March, 1949 religious leaders throughout the nation and those in foreign countries as well, will be observing Boyd Memorial Month. The R. H. Boyd Memorial Commission that was organized many years ago, which is headed by the Rev. A. A. Lucas, D. D. pastor of Good Hope Baptist Church in Houston, Texas, and Henry A. Boyd, the son of the late R. H. Boyd, of Nashville, Tenn., as secretary made the announcement early last fall that they had again selected the month of March as Boyd Memorial Month, because it was on the 15th day of that month more than a hundred years ago, that the late R. H. Boyd saw the light of day on a farm in the state of Mississippi, but before he was five years old the family migrated to Texas, thus he is often referred to as a native of the lone star state. In fact, he knew nothing of Mississippi except from faint memory. Thus he became a Texan in every sense of the word, as he was emancipated in that state back there on the 19th of June, 1865 when General Granger went down to Galveston to enforce Abraham Lincoln's famous document which freed the slaves, but they were several years late receiving its benefits in Texas. He worked on the farms of that state, he was a cowboy on the plains of Texas. he was a saw mill worker, and then he became a Baptist preacher.

The late Dr. Boyd's life's history, which is real however, reads almost like "Jack and The Bean Stalk" story, but in reality it is more like the Biblical Injunction which says, "He grew in favor with God and man", because the most outstanding work of his whole life was the organizing of the National Baptist Publishing Board and the building of the mammoth National Baptist Publishing Board's House, located at Second Avenue North and Locust Streets in Tennessee's capital city. There goes out from this institution millions of copies of publications, periodicals, song books, newspapers that have source material for every department of church life. In addition to this, this same plant supplies church helps, requisites, furniture, such as pulpit, chairs, pews, they even supply communion sets, baptismal garments; to be specific, the National Baptist Publishing Board, established by this leader who towered above many others, not only in height physically, but mentally and intellectually, is the largest printing plant operated, owned and controlled by Negroes.

It has often been said that he was the first ordained Negro Baptist preacher in the state of Texas, that he was present at the organization of the first Association in the lone star state among Baptists, that he was at the forming of the first State Convention in the lone star state, and was on the scene sixty-nine years ago when the National Baptist Convention of America came into being. He was the father of the idea of "Negro Dolls for Negro Children", he was the president of the Citizens Savings Bank & Trust Company, which is now the oldest Negro bank in the United States. He was a member of the International Lesson Committee, of the World's Sunday School Association, the World's Baptist Alliance, the International Council of Religious Education, the United Members of Friendship Lodge, the Masonic Lodge, the Odd Fellows Lodge, and he was the promoter of the Sunday School Congress, which is now nearing its forty-fifth birthday. He produced the first Baptist Sunday School Lesson Commentary ever to be printed in America, and he compiled, printed and distributed the first National Baptist Hymnal with words and music, in the denomination Too much cannot be said about what he contributed to the religious life of the Baptists, not only in America, but the world.

The R. H. Boyd Memorial Commission consisting of one hundred persons, through the instruction of its chairman, Rev. Dr. Lucas, has had a bust of the late Dr. Boyd taken from a picture, made of bronze, with the names of the one hundred members of the Commission on it. This plaque will be hung in the front office of the administration building located at Second Avenue North and Locust Street, which is but one of the six buildings that the plant occupies.

Those holding Memorial Exercises, if it is not inconsistent with their dignitaries, may send a contribution from the exercises to the R. H. Boyd Memorial Commission, that will liquidate the indebtedness incurred by this Commission several years ago when the life-size statue of him who has been honored, was placed in the building, and when the plant was set aside as a Memorial.

Noah

By H. E. Goodloe

It is interesting when one takes time out to study in terms of the activities of man. In everything good or bad, there are always two forces at work. Example: (1) Cain killed Abel because of differences of sacrifices to God. (2) God told Adam not to eat of certain fruit in the Garden. Satan persuaded him to partake of the fruit, (3) and finally because of wickedness, the world was destroyed by a flood, with the exception of Noah and his Ark. Because of the very fine work of Noah, he goes down in history as a hero in Kingdom Building.

Why are withCMFW CMFWGF

Why was Noah chosen for such a stupendous task? Why was it necessary for the world to be destroyed? The answer to the first question is simply this, "Noah was a just man," and because he was just God confided in him His plan to destroy the world because of sin. Also he assured Noah and family that they would be saved because Noah was a just man.

Why destroy the world? It was necessary because it was filled with sin and wickedness. After about eight generations, the Sons of God saw their daughters marry men who were enemies of God. As a result wickedness began to spread to the extent that God said "I will destroy man whom I have created from the face of the earth, both man, and beast, and creeping things and the fowls of the air."

The world was destroyed. How did Noah carry out his commission?

1. He was man enough not to be led off into the same wickedness that caused the world to be destroyed.

On the other hand, he proved true to a trust in a time that real manhood was needed.

2. He built the Ark according to God's plan. It was large enough to take care of all who should repent and turn to God. Today, the Ark of God is large enough for all who should repent and turn to God.

3. While Noah was doing such a fine job of leading the forces within the Ark. Everything on the outside was being destroyed. A whole year passed before the inhabitants of the Ark could leave. (1) A raven was sent out, but it never returned, (2) A dove was sent forth but it returned, (3) another was sent forth and it returned, and (4) another went forth and never returned. This was the signal that it was safe to unload. This showed carefulness, patience, and a willingness to experiment on the part of Noah.

4. When Noah was again on land, he built an altar unto the Lord and made an offering which was accepted. Then the Lord said, "I will not again curse the ground any more for man's sake."

5. Finally, Noah gave the world a beautiful picture of Christ. Through Noah, God provided an Ark of safety for the first judgement. The second judgement was the Ark of Jesus. All have sinned and must be purnished. Jesus came and took our punishment. He went through the Judgement for us. When we accept Him, we go into the Ark of Safety, and God closes the door and makes us secure.

Noah, a great hero, a character who lived a fruitful life. Honest, noble, true, and yet human enough to sin. He was the instrument in which a great blessing was wrought for mankind.

Harry: What grows up as it grows down?

Jerry: I give up.

Harry: A duck!

Fire in the Home

Fire is likely to strike anywhere. But the home is its most popular single target.

Last year, for example, there were 360,901 building fires in United States urban areas. More than 250,000 of them 70 per cent—occurred in homes. And, according to reports made by fire chiefs to the National Board of Fire Underwriters, fires in communities with population of 2,500 or more killed 5,200 peoplee. The toll in smaller towns and rural areas was also very great. Indeed, farm fires are often the most destructive, due to the lack of organized fire-fighting facilities.

Fire is always a blow to the home-owner and his family, and on occasion it can be catastrophic. If he has been foresighted, all or part of the physical loss will be covered by insurance—but insurance can't eliminate the nuisance and the difficulty of making repairs or replacements. If the loss is extensive, obtaining the right kind of materials and labor may prove a tough problem. He may be put to the expense of renting other quarters—if he's lucky enough to find them in these days of housing shortages—while the rebuilding goes on. And, at its worst, fire leaves death and financial ruin behind it.

Anyone with a bare minimum of common sense should realize by now that every member of the family should be carefully instructed in how to prevent fire—and, in addition, should know what to do if fire does strike. Quick action with a water bucket or a small extinguisher has stopped many a potentially grave fire at the start. And speed in calling the fire department has prevented ruinous losses.

State's Agricultural, Industrial Output May Exceed $3,000,000,000

Tennessee's industrial and agricultural production is expected to total more than three billions of dollars, state officials estimated recently.

Of this total, $2,750,000,000 will be in industrial production, according to Dr. G. I. Whitlach, of the State Planning Commission, and about $500,000 in agricultural production, according to the State Department of Agriculture.

American oil companies spend almost $100 million annually in a never-ending quest for new and improved products for use in industry, agriculture and the home.

Good Burley Tops $60 in Opening Sales

(Banner States News Scrvice)

Prospects for a merry Christmas in Tennessee were bright today as burley tobacco markets opened the 1948-49 season with prices for top grades breaking over the $60 mark.

It was generally agreed at warehouses in East and Middle Tenncssee, as well as Southern Kentucky, that the first day's averages would exceed those of last year.

Middle Tennessee's to price in the first few minutes of sales was $65. posted at several markets, while Greeneville, in the eastern portion of the state, listed a $75 basket.

High grade leaf predominated the first day's marketing and very little of the offering was reported to be going to the pools for want of a better bid: Growers expressed satisfaction with the early auctioning as the prices for lower grade leaf held in line with the trend on the top quality offerings.

In last year's opening sales, on 13 floors in Tennessee, the average price was $48.99 per hundredweight, and at several warehouses the first day's average was about $5 per hundred pounds over the 1946 mark.

In the first hour of sales at the Farmers Warehouse at Hartsville a top price of $65 per hundred weight was chalked up as sales moved fast. Indications were that the avcrage price today would top last year's opcning sales at Hartsville, where there are six floors.

Farmers Warehouse had approximately 800,000 pounds on the floor when sales began, and it was expected that half the poundage would be sold during the five-hour sale today.

It is estimated that the six Hartsville warehouses have approximately 4.000.000 pounds of the burley leaf on the floors. Sales will move on to another floor when all the present supply at Farmers is sold, and will continue from one warehouse to another as stocks are cleared.

Top grade light burley was selling consistently at $62 per hundred pounds at Carthage, where sales this year are expected to reach the $3,000,000 mark.

Poor grade was dropping as low as $20, and medium, or red leaf, was fluctuating from $40 to as high as $58 and $59 in the first two hours of bidding. The good grade prices however, were expected to pull the average up to a high point.

At Columbia it was predicted that today's average price would be about $47.50, slightly above Maury County's opening average last year of $46.73.

Many of the early crops were reported to be averaging $60, with the top price for a single basket, $63, going to E. C. Chappell. Maury County Tax Assessor Bailey Scott had the first of a number of $62 baskets.

A total of 411,000 pounds, from an offering of 700,000 pounds, was to be sold at Columbia today. Warehousemen reported the offerings were of "good quality" but "too high in case" because of the recent wet weather.

In Franklin's initial auction, at Casey's Warehouse, top grades were bringing from $60 to $64 in the early sale and officials believed last year's first day average would be topped.

Clarksville, a relatively new burley market, reported a high price in early sales of $63 but predicted that a new top mark would be set in later auctioning at the Banner Warehouse. Growers were "not complaining" as to prices, most of them expressing cofidence that last year's opening mark of $41.65 would be easily exceeded.

There was a total of 2,000,000 pounds on the 11 Clarksville floors today and it was believed that the Banner sales would not be completed before noon tomorrow.

Officials at the Peoples Warehouse at Fayetteville predicted that today's opening average would be about $9 per hundred better than that of $46.88 posted in 1947. The early high price was $63 going to numerous growers.

Among the top early was the $59 average going to Lee Hudson, Fayfor 1,110 pounds

Other high sales were those of J. C. Faulkner, Fayetteville, Route 1, 4,076 pounds for $2,031.28; D. Floyd Gray, Belvidere, Route 1, 1,792 pounds for $1,066,70; D. Y. Morehead, Mulberry, 792 pounds for $471.10; and Howard Hopkins, Tullahoma, Route 1, 918 pounds for $522.98.

Several baskets sold at a top price of $63 at Gallatin in the opening hours, and warehousemen expected today's average to be about $54.

The first basket at Greeneville sold at 75 cents a pound, according to Frank Emerson, president of the Greeneville Tobacco Board of Trade He said, howcver, that the average for the day's sales probably would be slightly in excess of $50.

Emerson said today's sales at Greeneville were expected to total around $250,000.

Johnson City's high basket in early sales brought 64 cents a pound. And at Knoxville, P. E. Vandergriff of Powell Station received $846.02 for a 1,440-pound basket for an average of $58.61.

Scott Dean, veteran Knoxville warehouseman, predicted the day's average would run between $53.50 and $54 on the basis of the first two hours of sales.

Morristown markets reported sales at the $50 per hundred mark on the average. However, no complete figurcs will be available until after the day's sales end.

Morristown also had a high basket to sell for $65, roughly five cents abave the high paid last year.

In the early auctioning of 155,000 pounds at Hopkinsville, Ky., a large number of baskets sold as high as $63 as compared to an early top last year of $61. Receipts going to the pool were very light.

Over 1,700,000 pounds of fine quality burley awaited buyers at the five warehouses in Springfield The leaf was thin and of good smoking quality, tobacco men said.

The Springfield Tobacco Redryers Corporation has opened to receive the local crop for the first season.

John Halliburton was serving as auctioneer.

Morgan Boyd, chairman of the Hopkinsville Board of Trade, said most deliveries to the market there had been of "good cigaret grade" and expressed the opinion that the price level would consequently be high.

The Hopkinsville floors held about 3,500,000 pounds.

Two Opposed Ideas

For most of us, our contacts with retailing are limited to a relatively small number of stores which we personally patronize. So we may lose sight of the fact that retailing is one of the mightiest economic forces in the country.

The statistics are extremely impressive. Retail trade provides employment for more than 8,000,000 people. Something like 70 per cent of the disposable income of America's consumers crosses its counters. This year, the volume of business done will reach the astronomical figure of $130,000,000,000.

But size alone doesn't tell the story. The fact that retailing is one of the most aggressively competitive of enterprises has been responsible for giving us more and better goods, at lower prices, than any other people enjoy. In countries where retailing is owned or eontrolled by the state, an opposite condition exists. For instance, the Soviet authorities recently approved the opening of some "free trade" stores in Russian-occupied Germany, where goods may be bought without ration coupons. Shoes sell for $54 to $72, stockings for $7 to $12, and so on down the line. The whole idea behind these stores is to get the last possible penny out of those who can afford to patronize them, in order to drain off excessive buying power. The idea behind American retailing is to give the most for the least money.

Retailing is the artery through which the products of farm and factory flow. It has made mass production workable, by providing an effieient mass distribution machine within easy reach of every family in the country. It is a mainstay of whole complex economy

Where Bibles Will Count

We publish here excerpts from a tract distributed by the Far Eastern Gospel Crusade and written by a veteran missionary in Japan. We have found nothing that more clearly portrays the golden opportunity for the Gospel in Japan.

By Anne F. Dievendorf

As we look back over the last twenty-five years and recall the restrictions with which we battled in our missionary work, we say, "Can this be the same Japan?" In our pioneer evangelism we found it more and more difficult to rent a plot of land to pitch our tent or to rent a hall for a Gospel meeting, and increasingly difficult to hold children's Evangels or Sunday school. Finally, in the late thirties, after the China incident broke out, we were asked not o travel from town to town without a permit; asked not to speak in public without notifying the police (usually the outline of or lecture was required); and later the children were forbidden by the school athorities to attend any Christian gathering. Besides all this we were asked to keep a record of the names of our callers, with addresses, for police inspection. The restrictions closed in upon us so that our hands were paralyzed. Then came the war and the long four years of internment. My sister, Miss Francis, and I were guided to remain in Japan, and the subsequent providences have vindicated that guidance.

When we were released from interment we came baek to another world—another Japan! Japan depleted, crushed, humiliated— but free!! In the process of emancipation the falsity and deception of pagan faiths were exposed, in a measure; and the people found what thy had been elinging to crumbled away and their hands and hearts were empty. Free— but empty, bewildered, confused but blinded by the superstitions of the past. Free-- but not knowing which way to turn. General MacArthur perceived this and writes of the "spiritual vacuum of the Japanese people."

The educated people of Japan seem so enlightened and cultured; can they be as blind as the rest? And we answer, "Yes! They have been educated in science, philosophy, and so on, without being given the Key to Life." What is the meaning of Life? Why am I here? Where am I going? Such questions only mock the soul; and the more so, where one is educated without Christ.

For the first few months after war closed, the people seemed dazed, stunned in a haze of bewilderment. Then the awakening! "Give us something dependable, something that will not change or be swept away in a few years." And again, "We must have something to cling to, something to put our faith in. What is there?

Newspapers and magazines are talking about the great revolution in Japan—political, educational, economical, social. It is left for us to depict the spiritual revolution, Everywhere the pople are reaching out after the Christian message Formerly people came seeking, one by one; now they come in groups. In our Prefecture(Ehimo) we are asked to speak before government officials, tachers, s'uderts, nurses, railroad officials, factory workers, women's clubs each group making their appeal to us to come! "What is the earliest date you can give our town? our school?" And after every lecture a group of earnest seekers come and ask to hear more. Often a Bible-study class is formed. All through the past months my sister and I have traveled from town to city, meeting groups of five hundred to a thousand and over

We had a three-day meting in a mountain town where there was a church built before the war. The first night the building was crowded. The people listened eagerly to a vital message on salvation through Christ. At the close we asked all who wished to hear more to raise their hands. Almost every hand went up. Then all who wished to be prayed for, were asked to remain. They all remained! The next day arrangements were made to hold the services in a larger hall at the school. Again we preached Christ, and Him crucified, in that school hall where for five years the very word Christianity had been banned. Some came to the assurance of saving faith that night.

Rccently the Education Department of the City Office asked us to speak before the principals of all the schools in Matsuyama and environs. There were about a hundred present. We spoke of the principles that underly true education, summing it all up with our usual message. The lectures cnded ust befire noon. A group of principals came to us and asked if we would not take lunch at the school and afterward give time for discussion. We consented. When we assembled for discussions. the men all wanted to talk at once about the hope that came to them during the morning lectures. In their distress and bewilderment they had seen a guiding light as they had listened. Since that time we have been flooded with invitations to speak to their students and faculties. There are not days enough, and you can imagine how our hearts are torn when we have to send back the reply: "No hope of visiting yor school for the present."

Just recently in passing I was able to stop off one night at my former station in Hiroshima Province (Fukuyama). One of the Christians, discovering I was there called together a group of young men who had heard my messages for the first time when I was there three months before. How their faces had changed! Each one told me of the transition from confused reasonings and darkness into clear light of faith in God. We sang together "On Christ the Solid Rock I Stand." One of them feels the call to the Christian ministry—a quick transit from a barren desert to the garden service for God.

What words shall we use to picture the hunger of this nation after the Truth? Everywhere we go the fields are white alrady unto harvest. Did ever such a call challenge the Christian youth of America? When we think of the young men who fought so valiantly to win the war, surely there are those who will invest their lives in the Christian warfare against darkness, superstition, paganism, and bring Christ to a seeking people. We have no time to spare. Who will get there first—the Communist or the Gospel messenger?

We are still doing a great deal of relief work on the side. The clothing which has come to us is protecting many a wee child and many a grown-up from the biting cold and winter winds. The medicine sent has done its healing work and opened hearts' doors to the Gospel. Considerable food has been distributed to those in need.

Our Japanese Christian workers are doing their best, but they are few; and they are depleted and worn aftr eight solid years of war. During all these wear years it has been impossible to train new recruits for Christian service. All young men were thrust into war work of shome kind. At this hour we need missionaries with the fresh vigor and strength of their young lives. We need them both to preach to the people and also to help in the training of Japanese evangelists; and we need Bibles, thousands of them, in the Japanese language.

The American Bible Society has sent to Japan, we are told, over a million New Testaments and 120,000 whole Bibles. but there still seems to be a crying need. There are 60,000,000 people in Japan and practically everyone of ments and Bibles for these eager them can read. Bibles are positively more effective in Japan than in any mission field, just for that reason; so send us Testaments and Bibles for these eacer, hungry, hopeful people who are so ready for salvation!

My Snow White Rocks

Come out and see my nice pullet flock
Of 44 snow white Plymouth Rocks
From right here in Tennessee these chickens came
From a purebred flock of a laying strain
Since October 1 production has been
Just 80 per cent from this flock of hens
They live in a Tennessee Open Front House
Which I try to keep free of lite and louse;
With a low flat roof and tight wooden floor
With good. dry litter, five inches or more
And a dropping board to keep it clean
And a ventilation system, the best I've seen;
With an open front to admit the light
But with back and sides so good and tight,
Feed troughs that don't waste a bit,
Good oyster shell and granite grit
Now these White Rocks won't act so niee
When drinking water is cold as iee
So heater was placed in the drinking pan,
A 25 watt bulb in a can of sand,
On a cold and snowy winter day
They eat and drink and sing and lay,
A man as poor as an old church mouse
Can build a Tennessee Open Front House.
Of the brooder house, I'm justly proud
It was built by a simple minded man
Who knew no better than to follow the plan.
It may have faults but so few they are
Every one you find wins a good cigar.
For six years it has stood the test
And demonstrated what is best.
On March the ninth my chicks arrived
With 102 very mueh alive
But when they weighed about a pound
Coccidosis signs were found
I cleared the house and sweep it clean
And treated with Sulfaguanadine
With net results whe nthe course was through
Of a total loss of only two.
In fact, my losses, all in all,
Were only six from spring til fall.
My electric brooder, six years old
Never has let my chicks get cold
It's almost human, I'll voueh for that
That wonderful little thermostat
Cuts off the "juiee" and turns it on
With even heat from night til morn,
At a cost that I consider good
t's even cheaper than coal or wood.
I've bragged til you think I'm a liar lousy
Come see my demonstration houses.
And if you can hire a simple man
Call for a Tennessee Extension plan
"know-it-all" He'll build you a
But if you hire a smokehouse long and tall
With a floor of dirt or perhaps concrete
That's damp and cold to the ehicken's feet
He'll face it East of North or West
When he knows darn well that South is best
But it matters little as to that
For he won't have a window big as your hat.
He figures that cracks in the hen house walls
Give air enough with no windows at all
He expects a house that's ten by ten
To house one hundred Barred Rock hens.

— W. J. Crowder, County Agent, Coffee County

100 Accredited Messengers Selected

General Secretary, Dr. Forrest L. Knapp Sends Acknowledgement

World's Council of Christian Education To Meet In 1950; Probably in Toronto, Canada

NEW YORK, N. Y. — (Special)— From authoritative sources here in this city it was learned that Dr. Forrest L. Knapp, general secretary of the World's Council of Christian Education, announced at the North American Administrative Committee meeting, Dec. 17th that he just received a check from Henry A. Boyd, secretary of the National Baptist Publishing Board of the National Baptist Convention of America, enrolling one hundred representatives for the coming World's Council Meeting to be held in 1950. It is said that Dr. Knapp announced that this was the first denomination in America to accept its quota and to pay cash so far in advance. It is further said that he stated to this Committee that when the Rev. Mr. Boyd was here during the month of November when the North American Section of this Committee had tendered a luncheon in Hotel Pennsylvania to the representatives who were in New York attending the meeting of the Denominational Executives, as the guests of the North American Administrative Committee, which was presided over by Judge Lewis L. Fawcett, that the plan was being worked out.

After the statement was made that in all probability the meeting would be held in Toronto, Canada, and each denomination was urged to take its quota, the Rev. Mr. Boyd representing the National Baptist Convention of America, accepted a quota of one hundred and agreed to pay the amount in advance. It is said that Dr. Knapp wrote Secretary Boyd later on that this check for the whole amount reached New York in time to be presented at the North American Administrative Committee Session on Dec. 17th. An acknowledgment of the remittance was immediately forwarded to the National Baptist Publishing Board's headquarters in Nashville.

This World's Council of Christian Education was formerly known as the World's Sunday School Association, and the Rev. Mr. Boyd has been a member for many years. He attended the convention when it was held in Tokyo, Japan, he attended another meeting held in Los Angeles, California, and he was present when the World Sunday School Association was held in Oslo, Norway; so he is considered up this way as one of the strong supporters of this organization.

Another Fraternity Elects Colored Student To Office

Teaneck, N. J., (G)—Roosevelt (Jack) Richardson, 21, of 200 West 124th Street, New York City, a sophomore at Bergen College in Teaneck, was installed on December 3. as vice president of Zeta Iota Pi, a fraternity at the college.

Of the belief that he is the first Negro to be so honored. Richardson, said that he has been a member of the fraternity since September and the only reaction that was exhibited by his fellow members to his election to the vice presidency was "one of cheerful congratulations."

He revealed that out of an enrollment of 2000 students at Bergen, only five are Negro.

Richardson is a photographer on his school paper and magazine and is studying for the dental profession. He attributed the student's tolerance at his school to the "Country-club atmosphere" existent there.

Dr. Fred Patterson's Information On Lynching

PRESIDEIT OF TUSKEGEE INSTITUTE GIVES TO THE NATION FACTS AND FIGURES ON 1948 VIOLENCES

The following letter was received by the National Baptist Union-Review early in Jannuary, sent out by Dr. F. D. Patterson, the president of Tuskegee Institute, in which he gives authority to release this information after December 31st. This letter was addressed to Secretary Henry A. Boyd, and in it Dr. Patterson said:

Dear Sir:

I send you the following information nconcerning lynching for the year 1948.

NUMBER OF LYNCHINGS. According to the records compiled in he Department of Records and Research of Tuskegee Institute I find hat 2 persons were lynched during the year. This is 1 more than the number 1 for 1947; 4 less than the number 6 for 1946; 1 more than the number 1 for 1945; and equivalent to the number 2 for 1944.

One of the victims was William H. Turner (alias Wilson Turner), a 26 year old white farm tenant of Meriwether County, Georgia, charged with stealing cattle from his landlord. He was placed in jail but later released for lack of evidence. Upon leaving the jail, he was chased from Meriwether County into Cowcta County by a group of white men, led by the owner of he stolen cattle, seized, beaten and his body burned.

The other victim was Robert Mallard, 37-year-old Negro of near Lyons, Toombs County, Georgia. There vas no charge against him. His apparent offense was he had incurred he enmity of his white farm neighbors because of his prosperity. Mooring home late at night accompanied by his wife, baby and two of his wife's young relatives, he was waylaid by a group of white men, who blocked the road and shot him to death.

BORDERLINE CASES. There was 1 borderline case, not included in he total number of lynchings for 1948 for the reason that in one respect only it does not conform to criteria used. This victim was Isiah Nixon, 28-year-old Negro, who insisted on voting in Georgia's Primary election after being advised not to to do so. On the evening of the same day he voted, two brothers, white, went to Nixon's home nd shot him. He died two days later in a hospital.

LYNCHINGS PREVENTED. In t least 7 instances lynchings were prevented by officers of the law. All of these were in the Southern States. A total of 19 persons, all Negroes, were thus saved from death at the hands of mobs.

PUNISHMENT OF LYNCHERS. For participating in the lynching of William H. Turner, 1 person received the death sentence and 3 persons are sentenced to life imprisonment.

Very truly yours,
F. D. Patterson
President.

ABBIT POPULATION ECLINING IN STATE DR. AYFIELD SAYS

Rabbits are not as plentiful as ey were several months ago. Dr. George R. Mayfield, chairman of he Tennessee Conservation Commission said today.

Dr. Mayfield said he made a poll n several Middle Tennessee counies, and discovered that the rabbit s disappearing in many areas—but ot for good, however.

Indications are that either the abbit is being killed in large numers or he has decided to leave Middle Tennessee. Dr. Mayfield ointed out that only a few rabbits have been found in roads where hey have been hit by automobiles.

"The scarcity of dead rabbits on he road is an indicatian that something is happening to them," the naturalist said.

Lincoln Cage Team Playing Games With White Colleges

Jefferson City, Mo.,

—In keeping with the racial philosophy presently sweeping the country, Lincoln University (Mo.) through its scheduling of athletic events, is lending its bit to dispelling interracial barriers. The Varsity basketball team has already engaged in four games with white college teams for each of which this was the initial experience of his type. The first two of these games is believed to have been the first basketball games played between white and Negro colleges in Iowa. Other games have been played between mixed schools, but they were scheduled as exhibition games, while those with Lincoln were regularly scheduled games and played on a home and home basis.

William Penn College of Oscaloosa, Ia., is the home opponent with the Lincoln varsity team on Dec. 11. It is the prediction of Coach William Exum that Lincoln will play many more interracial games in the future, including games with Missouri schools.

Commenting on the treatment received by the team on the two-day trip into Iowa, Coach Exum said, "We were treated exceptionally nice, but there was no chance for us to believe that it was done especially for us. It seemed that it was their normal way of treating guests." The coverage given the game by the Iowa press was of a high quality.

Lincoln won its opener with William Penn College on December 2 by a score of 45-33, losing the next two games to Central College, Pella, Ia., and Eastern Illinois State College at Charleston, Ill.

Christian Students Hold Interracial Meet In Arkansas

Pine Bluff, Ark. — Lillie Mae Paschal, senior at Arkansas State College from Hot Springs, and Raymond Cousan (white) of Henderson State Teachers College, have been elected state co-chairmen of the Student Christian Association. A sectional conference of the organization was recently held at the Phyllis Wheatley Y. W. C. A. in Little Rock with all Arkansas colleges and the University of Arkansas participating. The theme of the conference was "Our Social Responsibility As It Can Be Applied To Our Campus."

Those from Arkansas State taking part in the program were: the Rev. George A. Sewell, college minister, who headed a panel on "Political Action." with Willie Thompson, president of the Arkansas State student council, leading the discussion. Thompson is a senior from Little Rock. Dean John L. Wilson headed the panel on "Democratic Processes On the College Campus."

Ariel M. Lovelace, head of the music department at Arkansas State, directed community singing and recreation at the meeting.

Also representing the college were Doretha Johnson, Little Rock; William Loudd, Norphlet; Caleb Johnson, James Fiedmont, Sherman Baker, all of St. Louis, Mo.; Louise Lofton, E. St. Louis, Ill.; Milton Mapp, Little; Lillian Hill of El Dorado; Rose McSpadden, Batesville; Sadie James, Little Rock; and Annette Harris, Brickeyes.

Miss Bertha G. Merritt of the library staff also attended the conference.

Junior: Do you sell dry goods here, mister?

Clerk: No, this is a grocery store.

Junior: Sorry! I wanted to get some dried apples.

Convention Of CIO Stressed Needs Of Nation's Children

Portland, Ore.— (G)— An extensive program covering the care and protection of children from the cradle through the school years was adopted unanimously by the CIO Convention as one of the organization's major objectives. Two separate resolutions covering various phases of problems affecting youngsters were passed.

One outlining a general program listed these eight essentials necessary for the health, security and proper education of children:

1. Family incomes high enough to buy a good living and protection against the hazards of unemployment, sickness, accident and death.
2. Roomy, well built homes.
3. Proper medical care for both mothers and children.
4. Good schools with well-paid teachers.
5. Recreation facilities.
6. Protection against too early and unsuitable jobs.
7. Child welfare services to aid working mothers.
8. Communities so designed as to protect children and give them every opportunity to develop as healthy, happy human beings.
9. Great numbers of our children are forced to grow up in families and communities unable to provide these opportunities, the resolution stated and cited figures showing that over 100,000 children are victims of cerebral palsy; that 20,000 babies a year die needlessly, and that 100,000 each year are stricken with rheumatic fever or heart disease.

Joe Louis' Mother Wants Champion To Retire From Ring

Joe Louis' mother. Mrs. Lillie Brooks Barrow of Detroit. hopes and prays that Joe never will fight again. In an aritcle in SPORTS WORLD. Hillman's new publication in the spectator sports field Mrs. Barrow discloses, sums up her feelings by saying—"Say it ain't so. Joe.!"

"I know everybody says Joe is going to fight again. "she tells you. in SPORTS WORLD "but he hasn't really signed anything yet. He always told me not to pay any attention to rumors. I know he'll come home and talk it over with me, like he always has before, if he does decide to fight once more.

Written by Detroit Free Press sports writer Tommy Devine,. this frank article not only expresses Mrs. Barrow's hopes, but also gives a further insight into the character of Joe Louis, one of the most respected and well-liked sports figures of all time.

SPORTS WORLD also presents a full page four-color photo of the champ; more than 250 other excellent sports photos, and Bonus index of top-flight features and articles round out this first issue, which is now on sale at all newsstands from coast to coast.

United Nations Launches Drive Against Syphilis

PARIS — (Atlas News Service.- The United Nations International Chidlren's Emergency Fund has allocated $2,000,000 to start the first anti-syphilis campaign in history. The drive in which the World Health Organization is participating. is designed to help governments initiate programs for combating syphillis on behalf of children and expectant mothers.

Allocations have already been approved for Bulgaria, Finland, Hungary, Poland and Yugoslavia, and experts are presently surveying Italy and Czechoslovakia.

Fisk Basketball Team Wins Fourth Straight Contest

The Fisk University basketball team completed the first month of play with a record of three wins and three losses, and got off to a good New Year's start by handing the Knoxville College cagers a 48-46 defeat in the Pearl High School Gym on January 6. Fisk has shown considerable improvement in each game and teamwork has been the main feature of the attack. The quintet is now riding a string of four consecutive victories over Alcorn College 51-47, Alabama State 39-38, Xavier University, 50-44, and Konxville. The three defeats on the Bulldogs' record were administered by Kentucky State 83-44, Louisville Municipal 35-34, and Prairie View 58-45.

The Fisk-Knoxville College game was a second-half thriller. Both teams were slow starting and halftime found the score deadlocked at 22-22. Fisk junmped to a three point lead at the start of the second half, but could not maintain the pace. With two minutes to play Knoxville took a two point lead, but Collier swished the net with his favorite hook shot and tied the score at 44-44. Fisk then went ahead, only to have Knoxville tie the score with 30 seconds to go. The horn sounded with Knoxville vainly trying to score after Fisk had taken a final ten second lead.

Collier was high point man for Fisk, with 14 points, but the hustle and speed of Christopher West from Tulsa, Okla., put him in the hero's spot for the Fisk cause. Scoring honors for the night went to Smartt of Knoxville who hit the net for a total of twenty-seven points.

Trend In Polio Upwards

WASHINGTON, D. C. — "Recent years have brought an upward trend in incidence of the mysterious and crippling infantile paralysis disease," reports Dr. Paul B. Cornely, Medical Director of Freedmen's Hospital, Howard University. He added that 1948 marked the sixth consecutive year of unusually high polio incidence and urged greater support than ever before for the March of Dimes drive to replenish funds of the local chapter and the National Foundation for Infantile Paralysis.

Dr. Cornely disclosed that reports of the United States Public Health Service over the past 15 years show the totally unpredictable waves of infantile paralysis across the nation. Further, these charts, which have been published by the National Foundation as part of its education service, indicate that an epidemic in a given area a year or two ago does not immunize that area during next summer's polio danger period.

"A war does not end with the signing of an armistice," Dr. Cornely said. "Neither is an epidemic of infantile paralysis over when the last new case of the prevalent disease has been recorded. There remains the grim reality of the aftermath. The greatest cost is yet to come—the cost of after-care and rehabilitation of the stricken.

Dr. Crnely cited various instances throughout the country where local chapters had paid out record amounts for patient care last year despite low local polio incidence. Even without epidemics many such capters found it necessary to apply for additional aid from the emergency fund of the national headquarters, to care for those stricken in previous years.

"In all, more than 400 local chapters in 42 states received aid from the emergency fund of national headquarters", Dr. Cornely declared. "Treatment of last year's stricken requires record funds in 1949. That's why everyone must give 50 percent more to the 1949 March of Dimes."

Time for Co-operation

Newsweek recently published an article on electric power, in which it touched on the controversy between advocates of public development and supporters of private enterprise. In this regard, it said: "The government must work with, rather than against, the private companies to maintain a healthy industry. In the past, Federal officials have intimidated the privately operated utilities, stunting their expansion in a number of regions. In planning and administering its projects, the government must take care to let private business know just where it stands and to cooperate with it in power distribution and otherwise."

That is a very moderate statement of the case. Socialized power has been urged with a fanatical determination which has totally overlooked the enormous cost to the taxpayers, which has led, in some instances, to wasteful and unnecessary duplication of existing facilities; which has attempted to hide the fact that free enterprise built the American power industry and still supplies most of our electricity, and which has disregarded the remarkable job done by the private utilities in meeting demand, and thus preventing anything like a serious power shortage.

We will need vast increases in our power supply in the future. And let no one believe that only the government is capable of handling it. The private industry has the greatest expansion program in its history in full swing now. By 1957, its capacity will be increased by 80 percent. The public treasuries will not contribute a penny of the cost—but will, instead, get heavy new tax revenues from the plants and other properties which are being built. In the light of all this, Newsweek's suggestion that government must cooperate with the industry is just plain common sense.

Do We Want Shortages?

An executive of an association made up of retail meat dealers has forecast that there may be a rise in meat prices during the first part of next year; as a result of the increase in our population, higher wages and purchasing power, and other factors. This, he went on, may lead to the strongest kind of pressure for a reinstatement of price controls. Then he said: "Shortsighted and misinformed leaders in labor and consumer groups and some politicians still are clamoring for a return to some form of government control of prices and distribution. They do not realize that if controls are imposed on one commodity, it automatically would lead to controls on others and in the final analysis we would have a government controlling our . . . economic lives."

Looking at the issue from a purely practical point of view, price control of meat, to use it as an example, would have at least two adverse effects. The government might, for instance, say that steaks shall sell for fifteen cents a pound. But no one could sell at tht price without taking drastic losses. So the immediate result would be a siphoning off of more and more meat into the black market, along with a constantly decreasing supply in normal trade channels.

Even worse, from the long range point of view, would be the influence of price control on producers. Farmers and ranchers, finding meat production profitless, would turn to other crops or just shut up shop and call it a day. The livestock population would be cut to the bone. Then, in a year or two, we would have a real meat shortage, with all its deleterious effects on the national health and the national economy alike.

The problems created by price control are infinitely more dangerous than the problem it seeks to correct—price control would inevitably lead to wage control.

Coal Miners' Jobs

Fortune recently ran an exceptionally interesting item concerning the convention of the United Mine Workers. It said: "John L. Lewis. . . . rumbled about more pay for his miners; but what really worried him was the fact that coal production was running well ahead of consumption for the first time in seven years. Some 60,000,000 tons were piled above ground. . . ."

The reasons for large stockpiles of coal are varied. One lies in the remarkable performance of the industry in getting the product out and meeting the heavy demands upon it. But the significance of the situation. to Mr. Lewis and anyone else with an interest in the industry, is that coal is a fuel which is sold in stiff competition with other fuels—and that the cost of coal will have a direct bearing on the size of future markets.

That is important at a time when it looks as if Mr. Lewis plans to make further heavy financial demands on the operators. It might be possible for the union to demand and be given wages so high that the price of coal would soar into the stratosphere. But the union could not make people buy that coal, or prevent them from burning something else. So, in time, there would be less and less employment in the mines and inflated wage scales would be meaningless.

The average hourly earnings of coal miners approaches $2.00. The average weekly pay check is around $77, and many miners earn $100 and more. No comparable labor force is paid so well. Keeping that situation alive should be the miners' first concern—and it can only be kept alive if a large and growing coal market exists.

Kerosene Can Kill

Misuse of kerosene, or coal oil, causes hundreds of deaths each year, to say nothing of a heavy waste in property. And most of the damage is done in rural areas, where kerosene heating appliances are widely used.

The National Board of Fire Underwriters has issued some sound advice on how to reduce this hazard. First and most important, kerosene should never be used to start fires. The liquid vaporizes when poured into a warm stove, and this vapor may explode, igniting clothing and furniture. Injury, death and destruction may then follow.

Kerosene, like other liquid fuels, is frequently used in portable, open-flame heaters. It is all-important that these devices be cleaned frequently, be handled with care, and repaired at once when defects appear. They should never be filled indoors. They should be placed where they will not be accidently knocked over. And—of paramount importance—they should never be used in tightly-closed rooms, or left burning in bedrooms after the occupants have retired, because of the asphyxiation hazard.

Precautions such as these, simple as they are, show the road to safety from fire. And fire can be prevented. For example, Elizabethtown, Pa., with a population of 5,000, has had but one home fire in 50 years. Such fire prevention is the result of constant vigilance, and a strong sense of individual resposibility on the part of everyone who lives there. All communities, if they have the will, can emulate this splendid example.

Phillippine Scouts Want Raise

MANILA—The Philippine scouts who have been part of the U. S. army since 1901, want a raise in pay.

A Philippine scouts veterans' mission is trying to get to Tokyo to ask Gen. MacArthur's assistance, but has been unable to arrange transportation.

The scouts are paid on a "peso for dollar" basis. Since the peso is worth 50 cents, this means the soldier gets half what an American soldier does. This is almost twice the prewar pay. but the scouts say it is not enough. Their veterans' association wants to put on a dollar for dollar basis.

Allergy to Eggs May Cut Grades

ATLANTIC CITY, N. J. —(AP)— Allergy to eggs or other foods sometimes explains junior's poor school marks, pediatricians were told here last week.

This and some other strange effects of food allergies in children were described during a round table discussion at the annual meeting of the American Academy of Pediatrics.

The allergies can cause behavior problems, like obstinacy or poor school performance, said Dr. Susan Dees of Durham, N. C. Finding the guilty food, and taking the child off it, often cures the trouble, she said.

Get Asthma From Smell

Some children get asthma or hives simply from smelling foods they are sensitive to, Dr. Arthur Hoersch of Cleveland reported. One child gets asthma simply by being in the kitchen when his mother scrambles eggs, he said, another four-year-old gets asthma from smelling potatoes.

This smell reaction shows how exquisitely sensitive an allergic reaction can be. The allergy is started simply by the tiny amount of molecules of egg or potato which emanate from the food and can be detected as an odor.

Dr. Jerome Glaser, of the Rochester University School of Medicine, leading the discussion, said food allergies can appear even in the first week or two of a baby's life. They sometimes cause hives, colic, vomiting, and later skin diseases such as eczema.

In children, egg is the commonest food cause of allergy, with milk, probably next, and then wheat, he said. If the guilty food is removed, the trouble disappears. if the food is abandoned long enough, the child later in life often is able to eat it again without getting a reaction.

May Be Serious

It is estimated that 10 to 20 per cent of the population is sensitive to food at one time or another. He said. Serious trouble may result if the trouble is not diagnosed.

A strange effect of altitude was described by Dr. Julia Baker of Mexico City, highest city in North America. More children get allergies at that 7000 foot altitude than at lower altitude, she said. Sending the children down to a 5000 foot altitude cures them. This altitude effect isn't found at 5000 feet. No U. S. city except Denver is that high.

Dr. Harold L. Leeks of Philadelphia reported an effective new treatment to overcome the poisoning when children accidentally swallow big doses of anti-histaminic drugs. These are drugs used to overcome the effects of allergies like hay fever and asthma.

Child swallowing big doses get convulsions, and become stuporous. The convulsions can be controlled by use of ether and olive oil, given rectally, and the stupor and depression can be controlled by injections of benzedine, Dr. Leeks said.

N. F. A's Enter Baby Beef Show

Six N. W. A. boys of Union High School showed Aberdeen Angus calves at Gallatin and the Middle Tennessee Fat Calf show in Nashville. Prizes were given in this order: 1. James Polite, 2. Odis Williams, 3. William Head, 4. Alvin Cross, 5. Thomas Fitts, 6. Geo. Pope.

Donations were given by the following: Dr. I. C. Ramsey and Dr. Wilson ($6.00); Dr. J. F. Laird ($5); Dr. W. E. McKissack and Mrs. E. P. Hall and Rev. W. L. Shaw $3, Mr. E. V. Anthony $3, and American Legion Post 187 $2.

James Polite's calf was judged good in the show in Nashville and the other calves were judged medium. All boys will receive additional prizes.

Check your farm this month. See if you have a few extra acres to put to work. Maybe kudzu or sericea can go on the steep slopes. See if you can't get a few extra acres of permanent pasture in the moist bottom.

Care Now Will Protect Valuable Garden Tools

By DR. FLOYD BRALLIAR

Garden Editor
The Nashville Tennessean

Garden tools are valuable these days, therefore every one of us should take good care of what we have.

The wise gardener will take good care of his garden tools for he knows full well that if he has to replace any of them that it will cost much more than it did to buy the old ones.

We should have mentioned this sooner but we take it that most gardeners have at least taken their tools in out of the rain. The first thing to do to prepare your tools for the winter, is to wash them throughly.

Clean Off Soil

Be sure to get every bit of soil off the metal part of every tool. Then lay your tools in a warm place where they will dry very quickly. When tools are wet and left where they will dry slowly, they begin to rust within a few hours; and rust is the greatest enemy to tools of all kinds. Should your tools already have started to rust before you wash them up, rub all of the rust off that you can conveniently with a cloth, then lay the rusted tool over a hot radiator or some similar place until it gets hot enough that you cannot touch it with your hands. This will cause the rust to loosen somewhat. Do not get them too hot for it will do the tool damage.

Now oil the metal part of your tools well with any kind of oil that has body enough so it will not evaporate. No well-oiled tool will never rust, and if it is already rusted before it is oiled. the oil will gradually loosen the rust so that by spring most of it can be rubbed off easily.

Repair Injuries

Now go over the tools carefully and replace any broken handles, or similar injuries, and store them in a dry place for the winter. This is highly important, for we should remember the greatest enemy of tools is rust. This attacks the metal parts during the winter when the tools are in storage. and does more damage then than in the summer when they are in constant use.

If you have any wheel-hose, or other tools with movable parts, oil them well before storing, lest the bearings rust.

Don't forget to take care of all dust guns and spray guns. Take the nozzles of sprayers apart and clean. Oil the pumps of sprayers and set them away without screwing down the tank caps. so that the rubber gaskets are not compressed. Dusters should be cleaned and the outside metal parts oiled. but instead of oil, powdered graphite should be used on the inside.

Farm Talk with Farm Folk

By JESSE SAFLEY

Throughout the state, farmers have begun the annual task of killing hogs. Some have already butchered their entire supply, while others are waiting for colder weather.

Through observations made during the past several years, we are fully convinced that many families kill and cure more meat than is practical. It's not at all unusual to talk with farmers who butcher three, four, five and even 10 or more hogs each year. This is true in some cases where the family is extremely small.

Their reason quite often is "we like ham at our place." That is a good reason and no one will question the fact that practically every living person likes country ham. However, we do question the wisdom of using it in excessive quantities for two reasons. (1) This type meat is hard for the average individual to digest and (2) it is extremely expensive.

The idea of killing a large number of hogs each year is a practice held over from our ancestors who were forced to cure their summer supply of meat in the winter. They had to do without, otherwise. There were no stores then, where they could buy a few pounds of meat, fresh or cured.

There's also the argument that it's cheaper to kill meat at home than it is to buy it from the commercial butcher. This isn't true because markets and trucking facilities are available to most every producer. The one-time isolated producer can receive within a few cents as much for his animals at home as what he can get on the larger markets.

With the exception of hams, quality of home cured pork is low after five or six months. This is especially true of farm-cured bacon. When the weather gets hot, bacon strips become moldy and sometimes off flavored. There are also thousands of pounds of bacon and shoulder meat ruined each year from over salting or improper curing.

Even homemade lard often becomes so sour and moldy that it's difficult to use. However, it is used anyway to prevent loss.

We believe there is a solution to this problem. Instead of killing enough hogs to last all year, kill just enough for winter and spring. Sell the remainder of the hogs and use the money for buying fresh meats and cured bacon during the summer.

Now, if you can cure meat without any loss or without experiencing difficulties. we would not suggest that you change. On the other hand, if you do have bad luck, try this system.

Another thing. If you cure a large number of hams just to have enough to serve company who are forced to do without the delicacy in the city, quit fooling yourself. There is hardly a time when country hams are not available on the market.

"Bigness" Has to Be Earned

A history of the J. C. Penney Company, written by Norman Beasley, has just been published under the title "Main Street Merchant." It is a fascinating account of how one man, with energy, ambition and an idea, built a tiny store into the largest retail department store chain in the world. And, going beyond that, it shows how mass distribution, based on rendering the best possible service to the consumer, revolutionized retailing.

The principles on which the Penney Company was developed are typical of progressive merchandising. The basic idea was to charge only a fair price—never all the traffic would bear—and to give every customer the fullest dollar's worth of quality and value. As an example, the manager of one of the early Penney stores sent in an exceptionally good profit showing at the end of the year, and expected a letter of unqualified praise in return. The answering letter did compliment him—but it said also that the profit seemed too large, and that some o fit should have gone to consumers in the form of lower prices. He was instructed to work in the future with that point of view in mind. He did—and he is now a top man in the system.

This method of doing business brought prosperity to the Penney chain, as well as other merchants operating on the same principles. But the important thing to remember is that their growth and prominence had to be earned. They became big because, and only because, the public liked their goods and their services and prices, and trusted them. They have stayed big for that reason.

Husband's Complaint: When it comes to such activity as painting a room or pruning a tree, I've learned my wife's editorial "We" means ME!" M. G. Harvey.

South Alabamains can set out cabbage this month for early Spring heading. The chance of escaping damage by freezes is worth the trial. Plants are cheap so your risk is low. You can also grow some mustard, lettuce, carrots, Seven-Top and Cowshorn turnips.

Steel in America and Britain

Steel magnates here blocked Government allocation of steel a year ago, when there was widespread demand for such control, and adopted a voluntary system of rationing the supply which was short, cheifly due to the refusal of owners either to expand capacity or to adopt new methods which could, at a relatively low cost have increased production by at least one-tenth.

"Voluntary allocation" has failed and small users of steel for fabrication are now clamoring for Government action to assure them a fair share of the production.

Our Government, instead of asking the nationalization of steel to which the British Labor Party is committed, calls for social insurance.

Britain points the way on steel, and other industries, for America.

In Britain, coal, railroads, road and air transport, banking, gas and radio have been nationalized, as the British Labor Party promised in 1945.

Its platform also pledged nationalizing steel.

The steel owners hoped to prevent this, and began in 1945 a program of modernization at an estimated cost of $800,000,000, to be completed soon, to increase output in two years, to 18,000,000 tons.

The industry is now in the best condition of its history, while the coal industry was in about its worst, when nationalized and output per steel worker has increased about 10 per cent above pre-war levels.

In 1945 output was 13,243,000 tons is now 16,240,000.

The Government wants 22,000,000 tons a year within two years.

The steel nationalization bill now before Parliament postpones Government possession till May 1, 1950.

Under the bill, the Government offers the steel industry's stock and bond owners, about $1,200,000,000 although they want $2,500,000,000.

They are to sell on the basis of stock market quotations on certain dates in 1945 and 1948, whichever is higher, getting Government bonds in exchange, paying about 3 per cent. No dividends will be paid, and any profits will go to the Government.

The Government will take over 107 private companies and their subsidiaries, which produce 97.5 per cent of pig iron and 99.6 per cent of steel ingots in Britain, including all firms producing annually more than 50,000 tons of iron ore, or 20,000 tons of pig iron steel ingots, or rolled steel.

An exception is the Ford Motor Co., which operates steel mills with a capacity of about 100,000, for use in making its own cars.

Policies of the 107 big concerns are to be set by the Government's "Iron and Steel Corporation," whose Executive's salary of $35,000 a year is less than that of some 50 present steel executives, but the Government can replace executives increase or decrease their salaries.

The 300,000 steel workers will continue the pay and hours of work they have under private ownership, and there has not been any serious labor dispute in the steel industry since 1926.

Laidler Tells Responsibility of Labor and Industry

Dr. Harry W. Laidler of New York, Director of the League for Industrial Democracy, discussing, "What Labor and Industry Must Do To End Inflation," said:

"In innumerable cases wages could be absorbed by industry out of the present high profits or as a result of increased efficiency. A case for giving power to the government to limit wage adjustments can be made out, only where there are effective price controls, where increase in wages will cause a break in a price ceiling, and where wage adjustments are not essential to remedy hardship, to correct inequities, or to prevent an actual lowering of living standards.

"Business urged the elimination of controls on the ground that such abandonment would so stimulate productivity as to meet consumer demand and avoid an inflationary spiral. These prophecies, however, have proved to be utterly false, and unless the Government again steps in and takes control of the situation, the inflationary spiral will continue with tragic resuults on our economy and the economy of the world."

OPEN

A SAVINGS ACCOUNT

And

Add To It Weekly Or Monthly

You May Deposit In The Citizens Savings Bank And Trust Company, Nashville, Tennessee By Mail—This Bank Is Just As Close To You As Your Postoffice

Here is how it is done. Just send a postoffice money order, the cash by registered mail or a certified bank check to Henry A. Boyd, President of the Citizens Savings Bank and Trust Company, Fourth Avenue, North at Charlotte Avenue, Nashville (3) Tennessee, for the amount of money you wish to deposit in the opening of your account. The bank will then enter your savings account, or checking account, which ever one you prefer, in your name or in the name of any person you wish to make the deposit. They will also send you a Signature Card so you can sign the card just as you want your checks signed, when you are ready to make withdrawals, but please indicate whether you want a regular checking account which does not draw interest, or a savings account which draws interest. Savings accounts in this bank draw interest at the regular one per-cent per annum. The interest is credited January and July of each year.

This bank is a member of the Federal Deposit Insurance Corporation, which Corporation insures each account in the bank up to $5000.00. This bank is now forty-five years old.

President, Citizens Savings Bank and Trust Company

4th Avenue, North and Charlotte Avenue, Nashville 3, Tennessee

Consumers' Union Head Asks Ten Year Plan for Consumers

Dr. Colston E. Warne, President Consumers' Union, and Vice President People's Lobby Inc., called for a ten year national plan for consumers, at a recent Lobby meeting. He said:

"The ineffective strategy of consumer groups has for some years been that of bringing pressure to bear upon Congress for the enactment of particular legislative bills in the consumer welfare.

"Logic seems to call for a national plan for consumers which would assemble and inter-relate the targets for national growth. Such a national plan would be in the nature of a ten year budget of national income and capital growth. It would spell out the rate by which consumer living standards might rise. It would bring together a pattern of social reform and integrate it with the plan. We would have extended social security, Federal Housing, tax reform, banking controls, farm support prices, food stamp plans, minimum wages, and minimum wage scales placed in relationship to one another and to the national income as a whole. Such a national plan would afford an answer to the question of the rate at which we might develop power projects, extend education, build highways, or pay family allowances. It would be a single package, the ingredients of which might be shifted by the legislators."

"A start toward truly competitive business would be facilitated by developing a system under which small business might produce goods certified by the National Bureau of Standards that such goods meet minimum standards of performance. The consumer would thus have an alternative of buying highly advertised products or certified products. Competition would be enhanced. With a Department of the Consumer giving consumers information as to the meanig of the government certification, the consumer would receive better value for his dollar."

Oklahoma Farmers Making Progress

Grant, Okla. — Mr. and Mrs. Rhineheart have remodeled their home, adding two rooms and making other improvements, and are planning as soon as it is available to add electricity, so they can enjoy the comforts that are now available by rural electrification.

Mr. and Mrs. Gid Tucker have bought a home in Hugo, Okla., about one mile from town, in the Creosote Community.

The Pleasant Hill Baptist church of this community has been repaired, and a new roof has been put on the church. The pastor and officers of this church are looking forward to 1949, when they hope to accomplish more for the Cause than they did in 1948.

Mr. and Mrs. W. M. Morris of Choctaw County have built a new dairy barn ,and this barn had been been electrified through the Corp. Rea. Line. They are planning to improve their pasture by sowing it with the proper grass for grazing.

Mr. and Mrs. Green R. McRee are planning a turkey farm. They are rebuilding their terrace and have sown winter pasture for better grass. They also plan to grow yellow hop clover and other good grazing crops. The McGees have a 60 acre farm and plan to remodel their home. They are looking forward to having electricity in their home and on the farm soon.

Mr. and Mrs. Sam Rucker's daughter is building them a new home on their farm and they are happy over this fact.

GREEN R. McGEE, Reporter.

Seventy-one People Get 1.4 per cent of All Dividends and Interest

The favorite statement of standpatters, that "90 per cent of all stockholders in this country have incomes of less than $5,000 a year" means little.

Ordinarily about 25,000 people get approximately one-third of all dividends paid by domestic corporations. That doesn't leave an average of very much for the balance of the roughly 6,000,000 stockholders, big and little.

The Bureau of Internal Revenue reports that in 1945, (the latest year for which figures are available), the 71 persons reporting income of over $1,000,000, out of nearly 50,000,000 returns, had a total gross income of $123,384,000, and out of $3,838,457,000 total reported income from dividends and interest (not separated) this little handful of very multi--millionaires got $53,356,000, or almost 1.4 per cent.

Over 98.8 per cent of their income was from ownership or control of property.

Usually, the larger the income, the greater the part from property.

In 1945, the Bureau of Internal revenue reports there were 3,640,327 returns of $5,000 and over income, but as wealthy couples often make separate returns to reduce total liability, this probably means not much over 2,750,000 families.

However the Bureau reports that their total gross income in 1945 was $33,724 million which was 19.8 per cent of the $170,3 Billion total personal income for 1945, as reported by the Congressional Joint Committee on the Economic Report, of which Sen. Robt. A. Taft is Chairman.

That left the nearly 95 per cent of families with incomes under $5,000 with only about 80 per cent of the national income.

The Federal Reserve Board Bulletin for June 1948 states:

"In 1947 about one-third of all spending units had money incomes below $2,000," and its August '48 Bulletin says that in 1947, "13.5 million spending units spent about 11 billion dollars in excess of their income."

The CIO reports that in 1945, the 38,000,000 people with incomes under $3,000, received on the average, only $17 a year, or about 32 cents a week, from both interest and dividends. Interest included that paid on savings bank deposits, government bonds, etc.

The 71 people with incomes over $1,000,000 averaged about $750.000 from dividends and interest.

Mr. Henry Franklin Produced Twelve Bales of Cotton

Elba, La., (Special)—Twelve bales of cotton were produced by Mr. Henry Franklin without the aid of any outside help to cultivate the land, plow and pick this white fleecy staple from the stalks. Aside from his wife there are four children, namely: Henry, Otto, Priscilla Mae and Franklin, Jr.

In addition to the splendid amount of cotton that they produce they also operate their own truck garden, raise family vegetables, such as corn, potatoes, greens, tomatoes, lettuce, etc., which they market at the regular season. Then they have a reasonable amount of live stock on the farm, horses and mules, along with cows, so that they are never without fresh milk, butter and eggs.

They are just one group of the many progressive farmers in this part of the Delta State. They like to read the Modern Farmer, and they are predicting down here that they will have a larger organization and Local Chapter of the National Federation within the next month of two, than they have ever had.

U. S. Feeds West, Self for Record

Washington—(AP)— The United States shared a record amount of its food with other countries during the past crop year and still fed itself better than before the war.

So reported the agriculture department recently in a review of this country's efforts to help feed the hungry abroad.

Exports during the crop year ended last July 1 totaled 19,347,000 long tons. This is the largest quantity of food ever shipped by any country in a single year. It topped American exports of the previous crop year by 187,000 tons.

Had Plenty to Eat

Even after sharing this record supply, Americans had 14 per cent more to eat than in the 1935-39 period.

Exports are running heavy this crop year and it is quite possible that shipments will be even greater than those of the past year.

Grains ,including rice, made up about 81 per cent of the export tonnage. Wheat and wheat products represented about 67 per cent of the grain shipments.

On a quantity basis, Americans took 84.7 per .cent of the country's food supply. For some commodities, U. S. civilians consumed practically all of the supplies. Meat was an outstanding example. Exports of meat were about 1.1 per cent of the supply.

Most of the exported food went to countries receiving aid under the European recovery program. They got 65 per cent, other European countries 1.4 per cent. Far Eastern countries 16.4, Latin America 9.5, Canada 4.1 and other areas 3.6.

Dickson Finds Corn Thrives on Chemical

Dickson County farmers may find it more profitable to produce corn without cultivating it, Assistant County Agent Clifton Goodlett said recently.

On 12 demonstration plots on that many farms where a chemical spray containing 2-4-D was used in lieu of cultivations, it was found that the difference in yields was only 3.9 bushels per acre in favor of the cultivated areas.

"A farmer can hardly afford to cultivate a crop for that difference," Goodlett said.

The cultivated corn outyielded the sprayed in seven fields, the yield was the same on one and the sprayed crop was ahead on the other four. The average check plots yielded 51.8 bushels per acre, while the sprayed crop average was 47.9 bushels.

The chemical was applied at three different stages, but only one application was made on each field. In three cases the soil was sprayed after the corn was planted, but before it came up, two while the plants were coming through the ground and six were sprayed after the crop was up. There was no noticeable difference in the three sprayings, except in one case where it was believed that the chemical reduced the stand of corn. This was on one of the fields which was treated before the corn was up.

Goodlett said he believed that had the spray equipment more thoroughly distributed the chemical over the area, the results would have been more in favor of the non-cultivation method. At the end of the season there was very little difference in weed population on the two areas.

Experiments were conducted on the farms of Milburn Leathers, S. B. Noland, J. B. Stewart, Edwin Fuqua, N. J. Foster, Marvin Duke, Paul Hooper, J. W. Moore, Grady Hamilton, G. H. Gentry and Robert Stone.

Clay Lile of Erin, sprayed 300 acres of corn in bottom land was "lost" in weeks Goodlett said. The crop was saved and a good yield was harvested.

Chances are that several farmers in Dickson County will "lay by" their corn before they plant it next year, Goodlett declared.

U. S. Farmers Gobbling Up Crop Loans

Washington— (UP) — Farmers are flocking to the protection of the government's price support program, Agriculture Department officials said recently.

After a series of rich years in which domestic consumers and hungry foreign nations gobbled up all the food American farmers could grow, demand now seems to be tapering off.

And the farmer — remembering his distressing experiences after World War I—doesn't intend to be caught holding the bag for this year's record harvest. He's taking out government price support loans on his crops at what promises to be a record rate.

Commodity Credit Corporation officials, who carry out the price support program, said government loans had been authorized on 89,585,876 bushels of wheat alone through August 31. In addition the agency agreed to buy another 8,193,585 bushels if farmers can't sell the grain elsewhere.

Most agriculture department experts believe this is only the beginning.

They said that ultimately as much as 300,000,000 bushels of wheat and 400,000,000 bushels of corn will be placed under loan from this year's record breaking grain crops.

This does not include other grains such as oats and barley which also are eligible for price support loans, or such commodities as potatoes which are supported on a cash basis through purchase in the open market.

Some officials think commodity credit may have to underwrite as much as $1,500,000,000 in crop loans and direct price supports this year.

How much of this money will represent total losses to the government depends on future farm prices.

Under the loan program, the farmer sells his grain and repays the government if grain prices remain above the support level. If not, he lets the government take his grain. But if prices go up the government resells at a profit.

The anxiety of farmers to get under the government's price umbrella is reflected in the fact that last year, when grain was scarce and European needs high, only 31,000,000 bushels of wheat were put under loan. The largest amount of wheat ever put under loan was 408,000,000 bushels in 1942.

Piedmont. Alabama Farmer Finds Better Way to Make a Living

A good example of a farmer who made a change for the better is Lewis Murphy. As told by S. M. Harris, county agent for Coosa County. Murphy used to be an out and out cotton farmer. He added that he was a poor one at that.

Murphy is buying a 76-acre farm in the Equality Community. He has 40 acres in cultivation. At one time he rented extra land. Now his production per acre has been stepped up to the point where he no longer has to rent land.

In 1947 he began selling grade "B" milk to the cheese plant. He started with two cows. He now has four. His income averages $60 a month from these four cows.

For feed Murphy grows corn, soybeans, velvet beans and alfalfa. He has 10 acres of permanent pasture. He also grows manganese bur clover and oats for winter grazing.

Yes, he grew 4 acres of cotton this year and made 2 bales, states Harris. The strain on his cotton crop was relieved by his income from milk.

Murphy lives in the Piedmont area where small dairy units can be made very profitable.

People's Lobby President Says Armaments Threaten Domestic Economy

Dr. Broadus Mitchell, Instructor in Economics at Rutgers University, President People's Lobby Inc., at the Lobby's Conference in Washington on "Who Must Do What To End Inflation," endorsed the President's anti-inflation program, but said:

"There should be a sharp reduction in expenditures for arms and stockpiling of military raw materials as this is the expenditure which threatens the domestic economy and our huge military expenditures rob the world of physical reconstruction."

"Retail price controls and rationing ought never to have been abandoned so widely and orderly marketing of farm products is more to be wished than measures directly pushing up their prices.

"Our American economy is suffering an inflation, and is fevered, partly incoherent, though not yet delirious.

"The great depression of the thirties, and the Second World War, magnified the role of government in the United States economy enough to be dangerous, and not enough to counter-balance irresponsible elements."

Good Farm Management

Some first-class advice for the American farmer recently came from Dean William Myers, of the New York State College of Agriculture at Cornell, when he said: "It seems today that good farm management . . . calls for farm people to continue to build financial reserves in United States Savings Bonds rather than to enlarge their farm business beyond the size needed for efficient operation. The possibility of speculative profit from buying farm land or livestock when prices and incomes are high is seldom worth the worry and risk of losing everything if a drastic drops in farm incomes should follow."

The situation that followed World War I is in point. Prices and land values were high then, as now. In instances after instance farmers mortgaged their property in order to buy more. A disastrous break in the prices paid for farm produce came along—and a tragic number of farmers lost not only their new holdings, but their old places as well.

Everyone hopes that this will not be repeated. At the same time, it is only the part of wisdom for farmers to place a substantial part of surplus income in liquid assets —assets which can be immediately turned into cash if the need arises. Hhere is where U. S. Savings Bonds perfectly fill the bill. They are the safest possible investment. Depending on the type purchased, they either appreciate in value as times goes on or pay a good rate of interest. They are as liquid as cash in the bank. And, last but not least, they give the farmer and everyone the opportunity to own a financial share in his government.

Former Farmers' Council Head Gives Farmers' Anti-Inflation Program

Benjamin C. Marsh, for several years Director of the Farmers' National Council, gives the following farmers' anti-inflation program:

"To stop inflation, farmers must stop asking from government such special privileges as cheap credit, subsidies, 'parity' prices and low taxation of land values, which they properly resent when granted to others, and extend their efforts to stop the looting of the nation's natural resources, and to get a sound marketing system, and sound fiscal price and tax policies."

If You Go Hunting Observe These Rules:

Farmers and non-farmers alike will take to the fields and woods Wednesday on the opening day of the quail and rabbit season. Some will enjoy the sport on their own property, while the vast majority will be guests on farms owned by someone else.

Here are a few simple rules which might well be called the "hunter's code." Why not observe them?

1. Never walk onto a farm with a gun without the owner's permission.
2. Hunt on privately owned land only when the owner or some members of the owner's family can accompany you.
3. Respect no hunting and no trespassing signs.
4. Never shoot near farm buildings, schools and livestock.
5. Cross from one field to another only through places provided for that purpose. Close all gates you open.
6. Pay the farmer as much respect as you would expect of him on your property.
7. Start fires only when absolutely necessary and never leave a fire burning.
8. Be extra careful with matches and cigaretes.
9. Don't attempt to drive cars across farm. Car tracks often develop into gulleys.
10. Observe all hunting laws at all times.
11. Never combine drinking parties and hunting parties.

More Meat Coming

Next year, it is forecast, half a billion pounds more meat will be produced than in 1948—and the increase for 1950 will run to several billions.

The basic reason for this is interesting. It lies in the fact that livestock growers have decided to raise more meat animals. According to reliable authorities, these decisions by livestock producers, which will give consumers more meat in the future, are the result of present favorable livestock prices in relation to the price of feed. Thus it is seen that prices established in a competitive market serve to encourage increased production when demand is strong and there is an adequate food supply.

Moreover, competition also aids in the equitable distribution of meat to consumers. For example, if the price of meat were arbitrarily lowered by some sort of government price control scheme, supplies in retail stores would be cut quickly and late comers would face the "No Meat Today" signs common during the period of OPA controls. Such arbitrary price fixing also would tend to discourage production, for the producer cannot afford to sell at controlled prices when things he must buy are uncontrolled.

What it all adds up to is that nobody is going to work for nothing —or produce meat or anything else unless there is a chance to pay the costs and make some profit. That is why the competitive, supply and demand system is the only economy that makes for abundance—and why every controlled economy makes for scarcity.

State Will Have Group at Farm Bureau Meeting

Tennessee delegates to the 30th annual American Farm Bureau conference in Atlantic City, N. J., December 13-16, will leave on the sixth and seventh, President Tom Hitch said today.

Hitch said the conference will be of major importance to every farmer in the nation.

Government support for farm commodity price is prominent on the list of subjects to be considered, Hitch said.

The six-day trip en route to Atlantic City will be highlighted by visits to Washington, New York and Philadelphia.

Who Elected Harry Truman?

Ever since the election, some of the more prominent labor leaders have been claiming that the unions elected Mr. Truman. According to them, the biggest single issue was the Taft-Hartley Act.

That will take a good deal of proving to anyone who has made even a cursory examination of the final returns. Governor Dewey ran strongly in the industrial states, where the labor vote is proportionately largest, and carried most of them. The President, on the other hand, did extremely well in the agricultural regions where organized labor amounts to a small minority of the population.

Arizona provides the most interesting example. Mr .Truman carried it easily. Yet, at the same time, the voters approved a measure outlawing the closed shop. That certainly doesn't look as if the people want labor to hold the whip hand over the government or the people.

Mr. Truman does not owe his remarkable success to any group or any class. He wasn't elected by labor or capital or agriculture or any other segment of the nation. He was elected by the American people, and he is the President of all the people. He doesn't even owe allegiance to the Democratic leaders—most of them deserted him when they thought his cause was lost, and he won in spite of these unadmirable defections.

Harry S. Truman has a chance to go down in history as one of the great Presidents—as a man who, when the world was torn between slavery and freedom, stood staunchly for the liberities of mankind, and was too big to admit allegiance to special interests of any kind. The whole civilized world hopes that he may measure up to the enormous responsibilities that have fallen upon him. He has a chance now to rise above group prejudice or group selfishness.

Farm Prices Drop from Postwar Peak

Washington— (AP) — Average prices for farm products have dropped 11 per cent from the postwar peak of last January, the agriculture department reported recently.

A two per cent drop was recorded in the month ending in mid-November. Declines were listed for hogs, citrus fruits, corn, butterfat, tobacco and cotton.

The mid-November index of prices stood at 271 per cent of the 1909-14 average; last January's average was 307 per cent of the 1909-14 level.

In another report, the labor department said its wholesale price index rose 0.4 per cent in the week ending Nov. 23. Most commodities advanced slightly but foods declined a little, chiefly because of lower meat prices. The wholesale index on Nov. 23 stood at 164.9 per cent of the 1926 average and was 3.2 per cent higher than a year ago.

Club Leader Is Active at Age 76

At 76 years of age, Mrs. Minnie Richard still does a good homemaking job. She is an active leader and a booster for better farming and home-making. This was brought out in a report by home agent, Miss M. A. Shaw.

Mrs. Richard lives in the Screamer Community in Henry County. She has done outstanding work in sewing, knitting and rug making.

She still has good sight. She has made many beautiful quilts and bed spreads.

It may be of further interest to know that her family numbers 115 members. This count gives 12 children, 70 grand children, and 33 great grandchildren. Most of them live in Henry County.

Protect your hogs this winter. There are many types of low cost hog houses which you can build. Above all keep a dry pen with plenty litter for bedding.

WOMAN'S PAGE

Keeping House

A LITTLE OF THIS AND THAT: Have you tried the new mitt which you can wear on your hand to brush the lint off clothes, hats ,and shoes? If you haven't, you're really missing something. The mitt is a thick pad with several sheets of specially treated paper which whisks lint completely away. Just tear off the sheet of paper and the cellophane paper underneath it, and there's a fresh new sheet, ready for action—and lint! . . . Now you can buy new buttons which attach to fabrics as easily as a safety pin. They fasten by means of a tiny pin in back of the button. You'll find them in a variety of styles . . . . No more foggy mist on your bathroom mirrors, windows, or windshield, when you use "Clearsite," chemically treated cloth, to wipe them. One application is effective for at least one month.

FOOD FOR THOUGHT: A person is old only when he no longer desires to learn.

HOMEMAKER HINTS: Unsightly white marks caused by hot dishes can be removed from furniture by gently stroking the mark, and the area around it, with a slightly dampened cloth and silver polish, containing a very fine abrasive. If the area becomes lighter in color, use furniture polish or wax containing a dye to darken. . . . Down-filled pillows should be slapped at the sides and then given a good shake. Don't slap them on the front and back as this only makes them more apt to flatten themselves. . . . When ironing monogrammed or embroidered articles, you can make them stand out nicely by ironing them dry, face down, on a thick turkish towel. . . . Stale bread can be rescued tnd revived by sprinkling lightly with water, putting into a tightly closed paper bag. Pop bag into the oven, which should be about 350 degrees and your "fresh" bread will be ready in about 8 minutes.

RECIPE OF THE WEEK: NOODLES EL RANCHO

2 cups broad noodles
salted boiling water
6 to 8 slices bacon
¼ cup chopped green pepper
(if desired, ¼ cup finely chopped onion)
bacon fat
1½ tablespoons flour
1 large can tomatoes, drained
1 tablespoon finely chopped parsley
¼ cup grated yellow cheese
¼ teaspoon thyme or oregano
salt and pepper

Cook the noodles in salted boiling water until tender; drain them. Cut the bacon into small pieces and fry in a large pan. Remove when cooked but not quite crisp. Saute the pepper (and onion) in the bacon fat until softened. Add the flour and blend until smooth. Add bacon, tomatoes, parsley, and cheese, stirring to combine well. Add the noodles, mix all together; then add seasonings, stirring again. Cover, and leave over low heat for about 5 minutes or until piping hot.

DID YOU KNOW: That ripe tomatoes, like peaches, can be peeled, sliced, and served with sugar and cream? . . . That a little minced fresh mint and rosemary, added to canned pineapple, will bring out a wonderful flavor? . . . That you can make a soap jelly by boiling down odds and ends of soap with a little water? Apply the jelly with a brush to stubborn spots and stains . . . That you can shoot doughnuts into the frying fat with a new doughnut gun which is designed to be filled with batter. Pull the trigger, and perfectly round shaped doughnut batter (yes, with a hole in the center) drops out!

SAUERKRAUT CHOP SUEY
(Serves 4-6)

½ cup rice
3 tablespoons butter or fortified margarine
¼oz can sliced mushrooms
2 cups sauerkraut
1 tablespoon lemon juice
1 teaspoon salt
¼ teaspoon pepper
4 teaspoons soy sauce
1 cup cold cooked chicken, veal or pork, diced or sliced
¾ cup chicken, veal or other stock

Cook rice in boiling salt water until tender. Drain, pour cold water through rice and steam ten minutes. Melt butter in frying pan, add mushrooms and saute 5 minutes. Add rice and cook 5 minutes, stirring gently. Place 1-3 of the rice and mushrooms in the bottom of greased casserole. Mix remaining ingredients except stock. Place ½ of this mixture on top of rice. Add another layer of rice, then sauerkraut mixture, then rice. Pour stock over top. Bake in 350 degree oven over 30 minutes.

SPICED BEETS

6-8 medium sized beets
3 tablespoons butter
1½ tablespoons cornstarch
½ teaspoon salt
2½ tablespoons sugar
1-3 cup liquor from sweet pickle jar
1-3 cup water in which beets were cooked
1-3 cup very finely chopped sweet pickles

ROAST LOIN OF PORK

Loin of pork
½ tsp. dry mustard
Salt
Pepper
2 tbsp. butter
Thyme if desired

Wipe meat with damp cloth, score the fat surface. Mix the seasoning and add the butter, rub over the meat. Roast in shallow pan. Serve with baked apples and parsley garnish. Roasting requires about 35 minutes per pound in 350-degree oven.

PORK AND CORN FRITTERS

1 cup minced ctoked poek ltin
1 can corn
1 cup flour
1¼ tsp. salt
1 tsp. baking powder
¼ tsp. paprika
2 eggs
Fat

Chop corn, drain and add dry ingredients mixed and sifted; then, add pork and yolks of eggs, beaten until thick, and whites of eggs beaten stiff. Cook in frying pan in hot grease. Drain on paper. Serves six.

CASSEROLE OF PORK AND RICE

3 cups cold boiled rice
1 cup brown gravy, well seasoned
1 cup boiled or baked pork (cut fine)
½ cup chopped green peppers

Arrange in layers, bake 30 minutes in greased casserole or baking dish in 375-degree oven. Serves five.

FRIED CORNMEAL MUSH AND PORK

1 qt. boiling water
½ tsp. salt
1 cup cornmeal
¾ cup diced cooked pork loin
½ cup cold water

Stir cold water into cornmeal to avoid its lumping when stirred into boiling water. Add to boiling salted water. Stir five minutes, placing kettle directly over heat. Remove, place over hot water, cover and cook one hour. Add pork, pour into small greased bread pan, chill, slice thin and fry. Serves five.

PORK AND BEAN SALAD

1 can baked beans
1 cup cold baked pork loin, cut in squares
½ head lettuce
1-3 cup chopped green peppers
½ tsp. salt
Minced parsley
½ cup boiled dressing

Arrange lettuce on platter or individual salad plates. Mix pork, salt, beans and peppers. Arrange in lettuce cups enough for one serving; hollow out a space in top of mold large enough to pour in one tablespoonful salad dressing. Sprinkle dressing with chopped parsley, chill thoroughly and serve. Serves five to six.

CREAMED SPINACH

2 lbs cooked spinach
3 tbsp. butter
1½ tbsp. flour
1½ cups sweet milk
1 cup grated cheese
1 tsp. salt
¼ tsp. mixed black pepper
1 cup cracker crumbs

Put butter and flour in double boiler and mix well. Add milk, cheese, salt and pepper. Cook in double boiler until thick, then pour over finely chopped spinach. Add cracker crumbs and mix well. Place in baking dish and heat in oven until very hot. Serve with slices of hard-boiled eggs.

BAKED LOIN WITH NOODLES OR MACARONI

1 cup cooked pork loin
3 cups cooked noodles or macaroni
½ cup milk
½ cup water
½ cup crumbs
½ tsp. salt and pepper mixed
1 tbsp. butter

Grease a baking dish. Place in alternate layers cooked chopped pork and cooked noodles or macaroni. Season. Add liquid, cover with bread crumbs, dot with butter and brown in hot oven (400 degrees F.). Serves five to six.

ACORN SQUASH STUFFED WITH PORK AND RICE

6 servings squash
2 cups cooked pork (ground)
2 cups cooked rice
1 tsp. Worchestershire sauce
3 tbsp. onions (minced)
3 drops Tabasco
2 tbsp. minced parsley
Buttered crumbs

Cut two acorn squash in three pieces each and steam until tender. Combine the pork, rice and seasoning. Stuff the squash and sprinkle liberally with buttered crumbs. Bake and serve with cheese sauce. Baking requires about 35 minutes in 400-degree oven.

SCOTCH MEAT PATTIES

¾ pound ground beef
1-3 cup milk
¾ cup quick-cooking oats
Salt and pepper
2 tablespoons fat
1 cup water
¼ cup chopped celery
¼ cup chopped green pepper
¼ cup chopped onion
1 teaspoon Worcestershire sauce, if desired
1 tablespoon flour

Combine meat, milk, oats, 1 teaspoon salt, pepper. Make very thin patties; brown on both sides in fat in frying pan. Add water and vegetables; season with Worcestershire sauce, salt, and pepper. Cook covered over low heat 30 minutes. Blend flour with a little cold water, add slowly to the mixture, and cook until thickened, stirring occasionally.

To Complete the Meal

Serve with candied sweet potatoes, cabbage and carrot salad, with fruit and cookies for dessert.

For Variety

Sewing Hints

By MARY ANN KNOWIT

All ladies know how much more beautiful hemstitching makes plain tablecloths, sheets, napkins, guest towels, and a host of other household articles. Hemstitching is also very chic when done on ladies' blouses, dresses, and children's clothes. It is needless to say that hemstitched articles are much more expensive than plain ones, for every woman that does any sewing knows that. This week, I am going to give the instructions on how to do this drawn work so that it will be no financial problem to own articles that are hemstitched.

Hemstitching or drawn work can be worked only on the straight grain of material because threads must be drawn. It can be used at the top of a hem or wherever it is suitable. Voile or handkerchiefs linen, rayon crash, butcher linen or heavy crepe are good fabrics for hemstitching or drawn work. Any type of sewing thread is suitable fo rthis work. When it is used at the top of a hem, turn under and crease a hem of the desired width. If the piece is to be hemstitched all around, corners must first be mitered. Baste hem. Be sure that folded edge of hem follows a drawn thread of the fabric. At the corner, close to folded edges on the wrong side, clip the number of threads. Start hemstitching by bringing needle up through fold of hem and drawing thread through. Working on the wrong side, pick up four threads with needle from right to left. To make the corners of hemstitching secure, use a blanket stitch worked closely to hold edge together. . . . For plain double hemstitching, repeat the operations on the other side of drawn threads. For diagonal hemstitching, divide the groups of threads made on one side (taking two from each) when hemstitching the other side. For a simple pattern of drawn work where there is no hem, draw the threads and follow directions above. This is used when hemstitching is desired on the front of dresses, blouses and baby clothes.

Any lady who is interested in learning how to crochet may write to the Home Sewing department of this paper and ask for the free booklet, A B C of Crochet. Please send a stamped, self-addressed envelope.

Even Party Pancakes Can Be Made From Stock Supply On Pantry Shelf

PANCAKES and waffles are universally liked stand-bys that can be made of stock ingredients always at hand. The milk, so essential to good pancakes and waffles, in the recipe here is dry skim milk—the most economical form of milk which, because it needs no refrigeration, is always ready for service.

The technique of making these delicacies is simple. Sift flour before measuring, add melted fat and liquid together. Beat until smooth, but don't over-beat. There will be and should be a few lumps. But, if this technique is followed, there will be no leathery texture so frequently suffered by all of us in "just ordinary" pancakes.

Waffles and pancakes are one and the same thing, basically. You will notice in the recipe below that the only difference is the folded-in white of eggs in the waffles. You can use all sugar, but the molasses called for here makes for even browning.

A good griddlecake is well browned and tender. Grease the griddle lightly, unless you have one needing no fat. It's hot enough when a drop of cold water, dropped on it, jumps. Be sure to turn the cakes only once. They should be cooked slowly.

Try your hand at griddlecakes by this recipe, made nutritious, economical and easy by the use of dry skim milk. For a luncheon main dish make them large and thin, spread them with cinnamon, sugar and butter or with jam, stack them, and cut in wedges.

Griddlecakes

2 cups sifted flour
4 tablespoons dry skim milk
2 tablespoons sugar
3 teaspoons baking powder
1 teaspoon salt
1 egg
1-1/3 cups water
3 tablespoons melted shortening or cooking oil
1 tablespoon molasses, if desired

Sift flour. Measure. Sift again with dry skim milk, sugar, baking powder, and salt. Beat egg slightly. Add water, fat, and molasses. Mix well. Add all at once to flour. Mix carefully until just smooth. Bake on hot griddle until brown on bottom and bubbly on top. Turn. Finish baking. Turn only once. Makes 10-12 cakes depending on size.

Waffles: Use recipe above but separate egg yolk from white. Mix water, fat, and molasses and egg yolk. After mixing liquid with flour until smooth, fold in stiffly beaten egg white. Bake on waffle iron, heated and set according to manufacturer's directions. Makes 6 7-inch waffles.
